

Introducing vSAN Express Storage architecture

Adapting to changes in business demands and hardware innovation

vSAN Original Storage Architecture

The original storage architecture of vSAN is a two-tier architecture designed to accommodate a wide-ranging set of SATA/SAS devices

Designed to support HDDs and SSDs, wide ranging storage devices

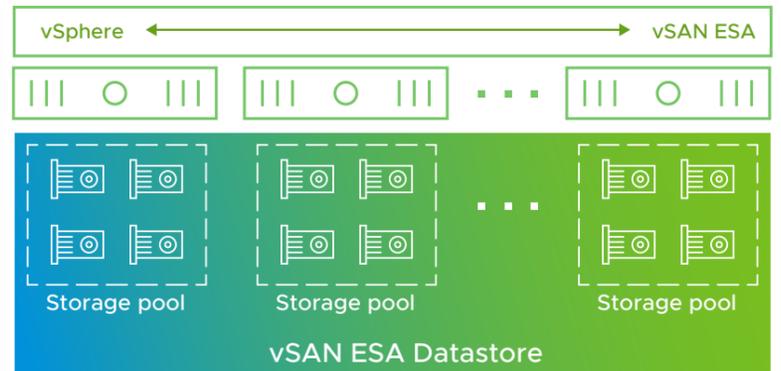

Uses disk group to provide performance through caching and capacity

Optional transition to

Change driving vSAN ESA creation

- 1 More performant hardware devices
- 2 New data security demands
- 3 New complex multi-tier applications powered by large VMs and containers
- 4 Workloads running not only on-premises but on public and private clouds

vSAN Express Storage Architecture

vSAN ESA is a new architecture designed to leverage multiple tiers of devices. Optimized for high performance NVMe-based TLC flash devices for both on-premises environments, and for the public cloud hyperscalers.

Optimized for high performance NVMe-based TLC flash devices

No disk groups. All devices contribute to performance and capacity

New Benefits

Performance without tradeoff

- Up to 4x higher performance, consistent and scalable
- High performant RAID - stores data in RAID-5/6 format at the performance of RAID-1
- Enterprise-grade snapshots with no trade-offs, negligible performance impact even with deep chains

Supreme resource and space efficiency

- Up to 70% more usable capacity, and up to 40% lower TCO*
- RAID-6 at RAID-1 performance: - 150% less capacity overhead over similarly protected RAID-1 VMs*
- Enable/disable data services on a per-VM/object basis

Ready-for-anything resilience

- Reduced failure domains improve availability upon failure
- Scalable native snapshots for improved backups and business workflows

Intuitive, agile operations

- Improved storage policies for simplified operations
- Simplified storage device provisioning and servicing
- Proactive Insights detects anomalies to prevent potential issues

With vSAN 8

An innovate way of delivering new capabilities for environments using modern hardware.

What makes vSAN ESA special

Fast & efficient data path

- New patented log-structured file system - A new layer that writes data quickly with minimal overhead
- Optimized data structure and I/O engine - stores data and metadata in an extremely fast and efficient way

Simplified administration

- Removes the concept of disk groups - makes adding and removing or servicing storage devices easy and efficient
- Adaptive RAID-5 policies and native snapshot capability - high performance snapshots

Ease of management

- vSAN Proactive insights -seamless and fast troubleshooting
- Adaptive network traffic shaping for resynchronizations - properly prioritize VM I/O over resynchronization activity

Top Use Case

- Mission-Critical Applications
- Databases
- Online Transaction Processing (OLTP)
- Edge

Here's Why:

- **High performance** from a new data path
- **Space efficient:** get the performance of RAID 1 with RAID 6, plus reduce total storage used with up to 8x data reduction via compression
- All storage devices contribute to performance and capacity so you can get the most out of your investment
