

Accelerate M&A Integrations with VMware SaaS App Management

Get visibility into your SaaS apps and identify security gaps

OVERCOME M&A CHALLENGES

- Gain visibility into which SaaS apps are being used across organizations and how they are being used.
- Manage multiple instances of the same SaaS app in a single location.
- Ensure compliance across all apps with comprehensive audit logs.
- Grant admins with the correct level of access and reduce security and data breaches risks.

VMWARE SAAS APP MANAGEMENT BY BETTERCLOUD

VMware SaaS App Management empowers IT admins to increase visibility over SaaS app usage, streamline operations, improve employee experience and enhance security.

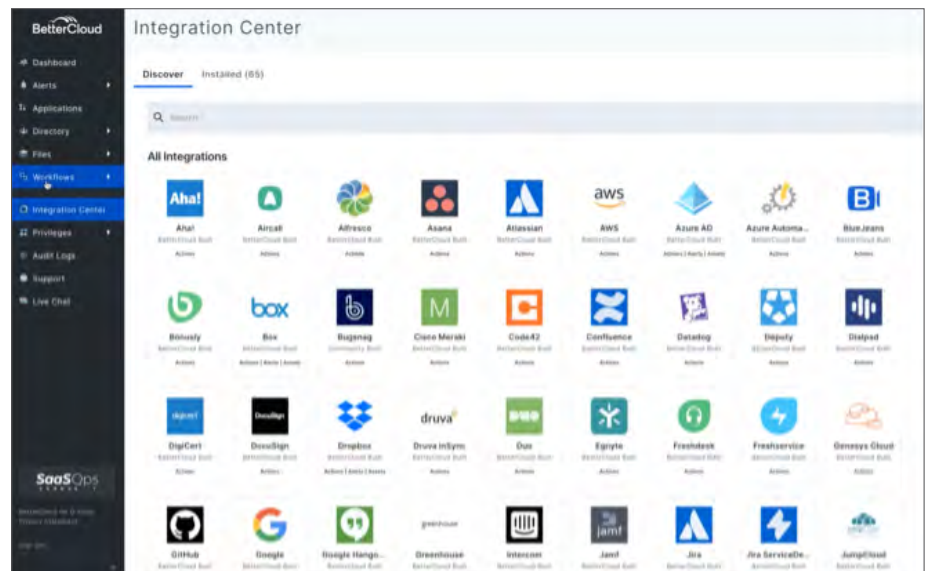

KEY BENEFITS

- **Improved visibility** – Learn how employees are using SaaS apps so that you can make data-driven decisions about app licensing, budgeting and data guidelines.
- **Increased efficiency** – Bring all data, users and controls across SaaS apps into a single, easy-to-use platform.
- **Reduced risk** – Secure your IT environment with data protection capabilities that automatically alert you of issues and help remediate them in real time.

One of the main challenges of mergers and acquisitions is slow system integrations. Delayed or ungoverned access to resources across organizations can prevent companies from realizing short-term and long-term synergies. VMware SaaS App Management™ by BetterCloud helps organizations overcome this challenge.

View all SaaS app data in one place

Unified visibility across all SaaS apps in your environment, including users, groups, files, channels, settings and other data. Get a holistic view of which applications exist in your new environment to make data-driven decisions.

Manage multiple instances of SaaS applications

As a result of the M&A process, organizations often need to manage multiple instances of the same SaaS application. To consistently manage these applications across policies, users, settings and so on adds complexity, requires manual work, and takes time away from valuable resources. VMware SaaS App Management makes it possible to manage multiple instances in the same place, giving IT teams the flexibility to control each merging company’s technology stack until it is consolidated. IT can

- View data holistically across the entire organization in one place
- Apply uniform policies and consistent privileges across instances
- Use the same automation across all instances for a consistent workflow

Ensure compliance with audit logs and granular admin roles

Robust role-based access-control capabilities enable IT to customize the level of access for each admin based on their job and responsibilities, reducing the number of admins that need super admin access during the transition.

Audit logs let IT track all actions and automations that admins are running in the platform. In a crucial moment of transition, IT can remain compliant with regulations and standards and keep a historical record of admin activity.
