Part Dev, Part Ops

DevOps Teams

The Challenge

Finding and Fixing Problems Fast

Speed of DevOps

Management at the

Delivering Log Insight Cloud:

VMware vRealize

Log Validation.

Try vRealize Log Insight Cloud

Gain the ability to get deeper insights into any native public clouds—and a way to visualize and respond to that information in real time.

How vRealize Log Insight Cloud Helps DevOps

The Solution

As information generation increases exponentially, the scale and volume of machine-generated data is increasing exponentially.

Failure happens often in development environments, and it takes DevOps teams too long to dig through logs to correlate data and metrics in order to find and fix problems.

Disaster recovery doesn’t just mean backing up data. It also means being able to analyze the logs that are generated during the disaster recovery process.

Getting to root cause is usually not an easy task, especially in distributed environments. And even when you are not dealing with distributed environments, logs are generally not easy to read and correlate.

The speed of DevOps requires effective log management, and that’s where Log Insight Cloud comes in.

The real challenge is to do this in an efficient, cost-effective way. Log Insight Cloud provides you with an efficient and cost-effective way to manage your logs.

The vRealize Log Insight Cloud Difference

Availability and the CI/CD pipeline.

Monitoring and troubleshooting codebase changes with application metrics can improve system and application performance.

Rapid troubleshooting and root cause analysis with smart log correlation.

Ability to store unlimited data without losing log data.

Vital visibility and actionable insight.

Get out-of-the-box public cloud content with native and custom dashboards.

The Scale and Volume of Machine-Generated Data Is Increasing Exponentially.
