

Deliver Secure, Ready-to-Work Experiences with Modern Management

As today's business pivots permanently to a hybrid work model, traditional on-premises and cloud-ready and cloud-bridge management tools are proving to be inadequate for setting up, patching and securing PCs that are off domain and off company networks.

To meet these challenges, industries from around the globe are turning to VMware Workspace ONE® cloud native modern management to empower their employees wherever they are. Learn from our customers why Workspace ONE is the best choice for managing all devices including Windows PCs.

IMPROVE EMPLOYEE EXPERIENCE

Today's end users are more mobile than ever and leverage a myriad of new device types to do their jobs. Ensure uninterrupted workflow with a self-service unified workspace on any device, anywhere with single sign-on (SSO) to any app or cloud service.

SEAMLESS ONBOARDING & ACCESS TO APPS

“An employee wants to start immediately. They want to be productive. They want to make contributions. From an IT perspective, we want to get IT out of the way. With VMware Workspace ONE, an employee can self-provision a desktop just like they do their mobile device. And they can be up and running in 15 to 20 minutes ... It's all about simplification. We wanted to take our point tools and provide a consistent experience for both IT and users across all devices.”

John Mockett
Director of Employee Technology and Support

WORK FROM ANYWHERE

“Our focus has shifted from local IT infrastructure to making IT work completely independent of location. VMware supports Zühlke's rapid growth and lets our people work from anywhere.”

Adrian Schwendener
IT Business Partner

CONSISTENT WORK ENVIRONMENT

“No one needs to be chained to their desk ... if they want to sit on the terrace, conference room or cafeteria, they should be able to do that without any hassle. Working back from that ideology, we want to get the right devices into the hands of our staff with as little stress or confusion as possible. Modern device management including drop-ship provisioning through Workspace ONE helped check a lot of those boxes. Now we provide a consistent and secure work environment no matter where and how they work.”

REDUCE IT TIME & COST OF MANAGEMENT

Save infrastructure costs with zero-server footprint, support costs with self-service and remote troubleshooting, and PC lifecycle costs with lower IT-touch management and out-of-the-box setup. Automate processes to save IT and end-user time and money.

CONSOLIDATE TOOLS

“One of the biggest challenges was that we had so many different tools to manage our devices. Workspace ONE helped us consolidate tools. Now we have this management tool where everything—encryption, software delivery, operating systems, patching—is done inside a single platform on one pane of glass. And not just for our Windows machines. The beauty of Workspace ONE is we can do this for multiple different device and OS types including Mac, iOS and Android. It gives us the ability to have a consistent set of policies and procedures, not only for us on the engineering side, but for the service desk and operations side too.”

Jeremy Fink
Senior Manager, End User Services

AUTOMATE PATCHING

“Previously, we thought about patching as a cycle. We'd pull down all the relevant patches for the month and deploy in some sort of cadence—over 30 days, for example. Now, rather than waiting to batch and deploy all of these patches every 30 days, we test and deploy them into the environment as they become available.”

Gifford Hart
Senior Manager for EUC

PROACTIVE SUPPORT MODEL

“We're getting to a proactive support model entirely within Workspace ONE. We are able to see how often devices are crashing, what sorts of apps are crashing on those devices, or if there's something else going on. That's allowing us to proactively contact individuals to find out if they have time to work through that problem. Or, even better, now we can deploy a fix immediately through automation without having to disrupt the individual. It opened so many doors to us that we'd never had before.”

Will Denham
Senior Manager, End User Services, Operations

DELIVER REAL-TIME SECURITY

Achieve policy and patch compliance on any network in minutes, not months. Detect and automatically remediate security vulnerabilities faster and more reliably. This way, you have the power to protect data on devices or in transit with full BitLocker lifecycle management and native per-app VPN.

ELIMINATE VPN

“During the pandemic, we saw people being productive but not needing to connect to VPN as much because many of the SaaS tools that we enabled allowed our team to securely connect directly from outside the network. Enabling the remote workforce required a heightened focus on security and IT to maintain visibility of what was happening across the fleet. Modern management with Workspace ONE and VMware Carbon Black Cloud™ are great solutions that are enabling us to improve manageability and visibility, update our remote access capabilities, and improve our user experience at the same time.”

JP Glick
VP, Team Member Experience

EASILY ENFORCE SECURITY POLICIES

“We like Workspace ONE and Carbon Black Cloud for the simplicity and flexibility they offer. They automate many of the manual processes we used to have in provisioning our users, whether it's installing software or enforcing security policies within the network as well as beyond the perimeter of our network.”

Josefino “Bong” M. Paloma
Executive Vice President, Technology, Sales and Marketing

VMware Workspace ONE is the most comprehensive, unified endpoint manager for Windows devices and beyond.

Join the ranks of leading organizations successfully automating IT operations, improving security, and delivering ready-to-work experiences across every device—whether on or off the company network.

See how you can save time and costs with Workspace ONE.
