To drive growth, mobility and innovation, businesses are looking to embrace the public cloud, but face critical challenges:

- Limited visibility into the different applications running in their environment and the cost to support this infrastructure
- Organizational silos across compute, networking and security teams and their separate tool sets impacts SLAs for resolving application connectivity issues
- Lack of tools that provide troubleshooting across private and public clouds

VMware Network Insight provides visibility into the applications and infrastructure in your multi-cloud environment, allowing you to:

- Plan application migration to the public cloud by mapping application dependencies
- Plan and troubleshoot application security regardless of where applications reside
- Troubleshoot application connectivity across clouds

Using VMware Network Insight to efficiently plan and manage applications in a multi-cloud environment, you can:

Minimize business risk
- Reduce risk to your business critical applications during migration and minimize vulnerability by securing them.

Make data-driven cloud adoption decisions
- Choose the right applications to migrate based on complexity and cost* of migration.

Increase visibility
- Get visibility into public cloud infrastructure and activities such as VMware Cloud on AWS and native AWS Virtual Private Clouds (VPC), EC2 instances, Security Groups and application flows and troubleshoot application connectivity across private and public clouds.

*Through integration with VMware Cost Insight

1,000+ customers are using VMware Network Insight to secure, migrate and ensure availability of mission-critical business applications including:
