Security Solutions That Enable Transformation With Confidence

Grow fearlessly, secure confidently with Accenture and VMware

Leverage our comprehensive suite of Confident Response solutions, enabling enterprises to combat ransomware and harness unique security protection.

Executive Face Considerable Security Challenges

Expanding across private, public, and even edge clouds can increase an organization's surface area for cyber-attacks and increasing risk for:

- **Accidental and malicious insiders** that can take advantage of the growing connectivity, expanding customer engagement channels, and new digital and mobile technologies.

- **Ecosystem/supply chain partner data theft and operational disruptions** from well-funded and organized threat actors.

- **Theft at point-of-sale systems** resulting in credit card data theft, violating compliance laws, and putting customers at risk.

Private clouds offer some security and compliance advantages when properly managed, but the hybrid cloud approach—combining the benefits of private, public, and edge—allows organizations to match the right workload to the right cloud, fitting the unique needs of your business. With a hybrid cloud, customers can reduce complexity and added risk while maintaining a strong security stance.

Coupling a fully developed strategy and cutting-edge threat intelligence with the development of a response that fits its' purpose, you can be prepared for tomorrow's security needs while knowing it is protected today.

The Accenture VMware Business Group's three-pillar security values approach ensures that a business can grow its security needs with minimal complications.

vmware®   accenture

Accenture and VMware Protect Companies Across the Globe

VMware's simple and secure solutions can work with any cloud—public, private or edge—delivering any application to any device, located anywhere. Customers using VMware get a consistent experience and set of features no matter where the solutions are running—from a single cloud to a multi-cloud solution.

Solution	A strategy-first approach with the flexibility to go hybrid	Build Zero Trust in one place	Workshops for a roadmap to success
Be Prepared	The need for Confident Security becomes increasingly important as more infrastructure moves to the cloud.	The ultimate expression of network-based security is Zero Trust, but the solution is architecturally complex and often expensive.	Confident Security is about strategy.
Shield Your Business	Focusing on hybrid cloud and the capabilities of VMware Cloud Foundation, Accenture allows superior security scaling across multiple clouds and the hybrid personal cloud environments vital to today's business success, all in a strategy-first manner.	Building a Zero Trust network that can span multiple clouds while still maintaining ease of access and preventing tool fatigue is a key component of such a strategy, and the single pane of glass VMware provides creates the foundation for it all.	Through a series of collaborative experiences, clients will gain an increased understanding of their current strategy and state of maturity while also developing a guiding vision for programs and roadmaps to success.
Trust Industry Authorities	Our approach eliminates much of the need for platform-specific tools that may be invalidated in the event of a provider change and builds a foundation of shared security principles to maximize value.	VMware NSX provides a centralized view where network decisions are made and tracked, making even complex architecture easy.	Customized Accenture VMware workshops identify weak points in existing architectures and organizational structures, then outline a plan to resolve issues and create a roadmap to the future.

vmware® accenture

Confident Response Solutions for Security From Accenture and VMware

We offer a comprehensive collection of Confident Response solutions, enabling enterprises to combat ransomware and harness unique security protections.

Carbon Black Managed Detection and Response

Ensure clients have complete coverage across their entire ecosystem, implementing the full investment of their existing security technology while enhancing both their threat detection and response.

Cyber Investigation and Forensics Response (CIFR) Threat Hunting

Covering 90% of the clients' environment, our proactive and predictive discovery solution helps identify threats and prepare an environment that is protected with modern security.

Malware Detection Innovation

Using custom VMware infrastructure coupled with artificial intelligence (AI), Accenture can create an innovative way of auto-classifying malware, building responses on the fly based on Mitre and the cyber kill chain.

iDefense Threat Intelligence

Bolster protection from ransomware by bringing the power of Accenture's iDefense to Carbon Black— augmenting top-of-the-line, industry-focused threat intelligence Endpoint Detection capabilities.

Accenture's Endpoint Protection

Leverage our advanced endpoint response (AER) to secure business-critical data by reducing alert fatigue with focus on the most relevant threats, addressing the skill gap and extending your team with our security professionals, and proactively detecting threats with unmatched intelligence.
