Bind DN	The Bind DN of the Active Directory user account that has privileges to search for users. The Bind DN account user record in Active Directory must include a username, first name, last name, email address, any required extended attributes, and a DN attribute defined in Active Directory. This user becomes the administrator for your Workspace deployment. You can promote other Active Directory users to the administrator role from the Workspace Admin Console. NOTE When multi-forest Active Directory is configured and the Domain Local group contains members from domains in different forests, the Bind DN user used on the Workspace Directory page must be added to the Administrators group of the domain in which Domain Local group resides. If this is not done, these members will be missing from the Domain Local group. The following examples are best practices when selecting the Base DN and Bind DN: ■ Base DN: dc=example, dc=com. Use the topmost level for Base DN so you include all users and groups. ■ Bind DN: cn=admin user, ou=users, dc=example, dc=com. Ensure that Bind DN is included in the Base DN you select.
Bind password	The Active Directory password for the Bind DN account.

Selecting Active Directory Users and Groups to Sync to Workspace

When you configure the Active Directory connection in Workspace, you set up a base DN as the point from where to search for users. This search includes all users. To restrict the number of users that sync with Workspace, you can create user-attribute-based search filters to exclude specific types of users.

The base DN you set up is used to search for users. To include groups in your search, you can create filters to add specific types of groups to the Workspace directory.

Before creating filters and adding groups in the Workspace, work with your Active Directory administrator to understand the structure of your Active Directory to select the correct users and groups to synchronize.

Using Filters to Add Users and Groups

You select the users and groups you want to sync to Workspace. The first sync occurs during the initial Workspace setup. You can make changes at any time from the Connector Services Admin pages.

Procedure

1. Log in to Connector Services Admin.
2. Select the Directory Sync page and click **Edit Directory Sync Rules**.
3. From the Select Users page, the base DN for Users text box displays the existing base DN. To add another base DN, click **Add another**.
4. From the **Apply Filters to Exclude Users** drop-down menu, to exclude certain user types, select the user attribute to filter by, select the query rule, and add the value.
5. Click **Add another** to add additional filters.
6. Click **Next** to add groups.
7. To find specific groups in the Selected Groups list, in the **Group Name Filter** text box, enter the group name you want to add.
8. Click **Add** next to the group names you want to include.
9. Click **Next**.

   The Push to Workspace page displays the number of users and groups you selected to add to Workspace.
10. Click **Save and Continue**.

    Active Directory is synchronized with Workspace.
