Today's internet is more than just web pages. When you surf online you are being tracked in a number of ways. Did you know? There are many ways to keep safe online including:

- Using a VPN service (to hide your IP address)
- Use two-factor authentication where available
- Use a password manager and stronger passwords
- Use Encryption
- Use Tor
- Use Browser Plugins (AdBlock, NoScript, Ghostery, HTTPS Everywhere)
- Block 3rd party cookies
- Block Location Data
- Use browsers' Do Not Track feature
- Using a different network configuration such as a VPN or Tor, without impacting the Host

Almost everyone on the Internet has downloaded something and regretted it later, and some software branded as 'free' can come with extra unwanted software that can do bad things to you and your computer.

VMware Fusion and Workstation provide an added layer of security and protection for any Mac or PC.

Find the VMware product that's right for you: vmware.com/go/personaldesktop
