## Overview

The following is an overview of current compatibility between the offerings of the VMware vRealize Automation. Information for unreleased products is subject to change. VMware does not support any application or operating system that is in BETA or has not been thoroughly tested by VMware's Quality Assurance.

For support matrix information specific to earlier versions of application services, see the vFabric Application Director documentation. Note that software components with vRealize 7.0 are supported only with Amazon Web Services, vCloud Air, and vSphere.

## Support Key

Y	Supported.
N	Not supported due to test results, has not been fully tested, or is not an available configuration.

## Host OS Support for (IaaS Components)

The following section outlines the Operating Systems supported to run IaaS components.

<sup>1</sup> SQL Server 2016 130 compatibility mode is not supported. If you separately create an empty SQL Server 2016 database for use with IaaS, use 100 or 120 compatibility mode. If you create the database through a vRealize Automation installer, compatibility is already configured.

<sup>2</sup> vRealize Automation 7.0 and later no longer supports use of an External Postgres database, and requires the use of the included internal version.

<sup>3</sup> vRealize Automation 7.1 and later no longer supports use of an External Postgres database, and requires the use of the included internal version.

<sup>4</sup> vRealize Automation 7.2 and later no longer supports use of an External Postgres database, and requires the use of the included internal version.

<sup>5</sup> vRealize Automation 6.0 and later uses vSphere SSO or the Identity Appliance for authentication, and does not connect directly to Active Directory. See the corresponding SSO documentation for Active Directory Compatibility.

<sup>6</sup> The Platform Services Controller (PSC) supports changing the name of the default tenant. Doing this causes the PSC to be incompatible with vRealize Automation.
