About This Book 9

1 Overview of VMware vShield 11
   vShield Components 11
   vShield Manager 11
   vShield App 11
   vShield Edge 12
   vShield Endpoint 12
   vShield Data Security 12
   Compatibility Between Different REST API Versions 12
   REST API Version 2.0 in vShield 5.0 12
   Multitenancy 14
   An Introduction to REST API for vShield Users 14
   How REST Works 15
   Using the vShield REST API 15
   Ports Required for vShield REST API 15
   About the REST API 16
   RESTful Workflow Patterns 16
   For More Information About REST 16

2 vShield Manager Management 17
   Synchronizing vShield Manager with vCenter Server and DNS 17
   Querying vShield Manager Configuration 18
   Registering vShield Manager Plug-In with vSphere Client 19
   Unregistering vShield Manager Plug-In with vSphere Client 19
   Querying Registration Status of vShield Manager Plug-In 19
   Monitoring vShield Manager reachability 19
   Working with vShield Manager Syslog Server Configuration 19
      Configure vShield Manager Syslog Server 20
      Get vShield Manager Syslog Server Configuration 20
      Delete vShield Manager Syslog Server Configuration 20
   Querying vShield Manager Logs 20
      Get vShield Manager System Events 20
      Get vShield Manager Audit Logs 21
   Querying vShield Manager Tech Support Log 21
   User Management 21
      Get a List of Users 21
      Get Information About a User 21
      Create a Local User on vShield Manager 22
      Update a Local User Account 22
      Enable or Disable a User Account 22
      Remove a User Account 23
   Role Management 24
      Get Role for a User 24
      Add Role and Resources for a User 24
      Change User Role 24
      Get List of Possible Roles 25
      Get List of Scoping Objects 25
Creating IPset and MACset Containers 25
   List IPsets Created on a Scope 25
   Create an IPset on a Scope 25
   Get Details of an IPset 26
   Modify an Existing IPset 26
   Delete an IPset 26
   List MACsets Created on a Scope 27
   Create a MACset on a Scope 27
   Get Details of a MACset 27
   Modify an Existing MACset 27
   Delete a MACset 28

Security Group Scope and Members 28
   List Security Groups Created on a Scope 28
   Create Security Group on a Scope 28
   Get Members for a Scope 29
   Get Security Group Details 29
   Modify a Security Group 30
   Delete a Security Group 30
   Add Member to Security Group 30
   Delete Member from Security Group 30

Transport Set for Applications 31
   List Applications on a Scope 31
   Add Application to a Scope 31
   Get Details of an Application 32
   Modify Application Details 32
   Delete Application from Scope 32

3 ESX Host Preparation for vShield App, vShield Endpoint, and vShield Data Security 35
   Installing Licenses for vShield Edge, vShield App, and vShield Endpoint 35
   Installing vShield App and vShield Endpoint Services on an ESX Host 35
   Installing vShield Data Security 37
   Upgrading vShield Data Security 37
   Getting the Installation Status of vShield Services on an ESX Host 38
   Uninstalling vShield Services from an ESX Host 38
   Uninstalling vShield Data Security 38

4 vShield Edge Installation 39
   Installing a vShield Edge 39
   Querying vShield Edge Configuration 40
   Uninstalling a vShield Edge 42

5 vShield Edge Management 43
   Configuring vShield Edge 43
      List vShield Edge Installations 43
      Determine API Version 43
      Get Capabilities of a vShield Edge 44
      Switch to New API Version 44
      Get Full Configuration of a vShield Edge 44
      Change Configuration of a vShield Edge 44
         Install vShield Edge 45
         Delete vShield Edge 45
   Configuring Edge Services 45
      Configure DHCP 45
         Manage the DHCP Service 46
Contents

Delete DHCP Configuration 46
Configure Firewall 46
  Change Firewall Rule to Allow 47
  Revert Firewall to Default 48
  Create Firewall Rule with IPset or applicationSet 48
  Delete Firewall Configuration 49
Configure Static Routing 49
  Delete the Static Routing 49
Configure NAT 49
  Delete NAT Configuration 50
Configure Load Balancer 51
  Manage Load Balancer Service 51
  Delete Load Balancer Configuration 52
Miscellaneous 52
  Reconfigure Edge Interfaces 52
  Set vShield Edge Credentials 52
  Configure Remote Logging 52
Configure VPN 53
  Manage VPN Service 54
  Delete the VPN Configuration 54
Generate Certificate Signing Request (CSR) 54
  Add X.509 Certificate as VPN Site 55
Operating vShield Edge 56
  Get Details About Edge 56
  Request Sync or Upgrade 56
  Get IPsec Tunnel Statistics 56
  Get DHCP Statistics 56
  Network Interface Statistics 57
  Get Service Status 57
Debugging and Support 57
  Retrieve Technical Support Log 57
  Get Service Statistics 58

6 vShield App Management 59
  Modifying the State of a Datacenter 59
    Retrieve Datacenter State 59
    Modify Datacenter State 60
  Configuring Firewall Rules for vCenter 60
  Configuring the vShield App Firewall 60
    Query Firewall Configuration 60
    Change Firewall Configuration 70
    Revert to Default Firewall Configuration 70
  Configuring Fail-Safe Mode for vShield App Firewall 70
    Configure Fail-Safe Mode for vShield App Firewall 70
    Get Fail-Safe Mode Configuration for vShield App Firewall 71
  Working with SpoofGuard 71
    Get SpoofGuard Global Settings 71
    Edit SpoofGuard Global Settings 71
    Get SpoofGuard IP Settings 71
    Save SpoofGuard IP Settings 72
  Working with Namespaces 72
    Add Namespace in a Datacenter 72
    Get Namespace Details 73
    Delete a Namespace 73
    Show Namespaces in a Datacenter 73
Show Port Groups that can be Marked as Namespace  73
Show Configured Namespaces in Datacenter  73
Getting Flow Statistic Details  73
Get Flow Statistics  74
Get Flow Meta-Data  75
Excluding Virtual Machines from vShield App Protection  77
  Add a Virtual Machine to the Exclusion List  77
  Get Virtual Machine Exclusion List  77
  Delete a Virtual Machine from Exclusion List  77
Configuring Syslog Service for a vShield App  78
Synchronizing vShield App  78
Querying vShield App Technical Support Log  79
Upgrading vShield App  79

7 vShield Endpoint Management  81
  Overview of Solution Registration  81
  Registering a Solution with vShield Endpoint Service  81
    Register a Vendor  82
    Register a Solution  82
      Altitude of a Solution  82
    IP Address and Port for a Solution  82
    Activate a Solution  83
  Querying Registration Status of vShield Endpoint  83
    Get Vendor Registration  83
    Get Solution Registration  83
    Get IP Address of a Solution  84
    Get Activation Status of a Solution  84
  Querying Activated Security Virtual Machines for a Solution  84
    Query Activated Security Virtual Machines  84
    Query Activation Information  85
  Unregistering a Solution with vShield Endpoint  85
    Unregister a Vendor  85
    Unregister a Solution  85
    Unset IP Address  85
    Deactivate a Solution  86
  Status Codes and Error Schema  86
    Return Status Codes  86
    Error Schema  86

8 vShield Data Security Configuration  89
  vShield Data Security User Roles  89
  Defining a Data Security Policy  90
    Query Regulations  90
    Enable a Regulation  90
    Query Classification Value  91
    Configure a Customized Regex as a Classification Value  91
    View the List of Excludable Areas  91
    Exclude Areas from Policy Inspection  92
    Specify Security Groups to be Scanned  93
    Query Security Groups Being Scanned  93
    Configure File Filters  94
  Saving and Publishing Policies  95
    Query Saved Policy  95
    Query Published Policy  96
    Publish the Updated Policy  96
Data Security Scanning  96
  Start, Pause, Resume, or Stop a Scan Operation  97
  Query Status for a Scan Operation  97
Querying Scan Results  97
  Get List of Virtual Machines Being Scanned  98
  Get Number of Virtual Machines Being Scanned  98
  Get Summary Information about the Last Five Scans  99
  Get Information for Virtual Machines Scanned During Previous Scan  99
  Retrieve Information About Previous Scan Results  99
  Get XML Representation of Policy Used for Previous Scan  99
Querying Violation Details  101
  Get List of Violation Counts  101
  Get List of Violating Files  102
  Get List of Violating Files in CSV Format  103
  Get Violations in Entire Inventory  104
Appendix 105
  vShield Manager Global Configuration Schema  105
  ESX Host Preparation and Uninstallation Schema  108
  vShield App Schemas  109
    vShield App Configuration Schema  110
    vShield App Firewall Schema  110
    vShield App SpoofGuard Schema  114
    vShield App Namespace Schema  115
  vShield Edge Schemas  116
  Error Message Schema  128
About This Book

This manual, the vShield API Programming Guide, describes how to install, configure, monitor, and maintain the VMware® vShield™ system by using REST API requests. The information includes step-by-step configuration instructions and examples.

Intended Audience

This manual is intended for anyone who wants to use REST API to install or use vShield in a VMware vSphere environment. The information in this manual is written for experienced system administrators who are familiar with virtual machine technology, virtualized datacenter operations, and REST APIs. This manual also assumes familiarity with vShield.

VMware Technical Publications Glossary

VMware Technical Publications provides a glossary of terms that might be unfamiliar to you. For definitions of terms as they are used in VMware technical documentation go to http://www.vmware.com/support/pubs.

Document Feedback

VMware welcomes your suggestions for improving our documentation. If you have comments, send your feedback to docfeedback@vmware.com.

vShield Documentation

The following documents comprise the vShield documentation set:

- vShield Administration Guide
- vShield Quick Start Guide
- vShield API Programming Guide, this guide

Technical Support and Education Resources

The following sections describe the technical support resources available to you. To access the current version of this book and other books, go to http://www.vmware.com/support/pubs.

Online and Telephone Support

To use online support to submit technical support requests, view your product and contract information, and register your products, go to http://www.vmware.com/support.

Customers with appropriate support contracts should use telephone support for the fastest response on priority 1 issues. Go to http://www.vmware.com/support/phone_support.
Support Offerings

To find out how VMware support offerings can help meet your business needs, go to http://www.vmware.com/support/services.

VMware Professional Services

VMware Education Services courses offer extensive hands-on labs, case study examples, and course materials designed to be used as on-the-job reference tools. Courses are available onsite, in the classroom, and live online. For onsite pilot programs and implementation best practices, VMware Consulting Services provides offerings to help you assess, plan, build, and manage your virtual environment. To access information about education classes, certification programs, and consulting services, go to http://www.vmware.com/services.
Overview of VMware vShield

VMware vShield™ is a suite of network edge and application-aware firewalls built for VMware vCenter Server integration. vShield inspects client-server communications and inter-virtual-machine communications to provide detailed traffic analytics and application-aware firewall protection. It is a critical security component to protect virtualized datacenters from attacks and misuse, and helps achieve compliance-mandated goals. This chapter includes the following topics:

- “vShield Components” on page 11
- “Compatibility Between Different REST API Versions” on page 12
- “Ports Required for vShield REST API” on page 15
- “An Introduction to REST API for vShield Users” on page 14

This guide assumes you have administrator access to the entire vShield system. If you are unable to access a screen or perform a particular task, consult your vShield administrator.

**vShield Components**

vShield includes components and services essential for protecting virtual machines in a virtualized datacenter. vShield can be configured with a Web-based user interface, a command line interface (CLI), or a REST API.

To run vShield, you need one vShield Manager virtual appliance and at least one vShield App or vShield Edge virtual appliance. The vShield Manager virtual appliance can run on a different ESX host than the vShield App and vShield Edge virtual appliances.

**vShield Manager**

vShield Manager is the centralized management component of vShield. You install it as a virtual appliance by deploying an OVA from the vSphere Client. Using vShield Manager’s user interface or vSphere Client plug-in, you can install, configure, and maintain vShield appliances. The vShield Manager user interface leverages the vSphere Web Services SDK to display tabs within the vSphere Client inventory panel. For details about the user interface, see the vShield Administration Guide.

**vShield App**

A vShield App virtual appliance monitors all traffic into and out of an ESX host, and between virtual machines on the host. vShield App provides application-aware traffic analysis and stateful firewall protection, and it regulates traffic based on a set of rules, similar to an access control list (ACL).

As traffic passes through a vShield App, each session header is inspected to catalog the data. The vShield App creates a profile for each virtual machine detailing the operating system, applications, and ports used for network communication. Based on this information, the vShield App allows ephemeral port use by permitting dynamic protocols such as FTP or RPC to pass through, while maintaining lockdown on ports 1024 and higher. You cannot protect the ESX Service Console, ESXi direct console user interface (DCUI), or the VMkernel with vShield App because these components are not virtual machines.
NOTE vShield App and vApp are not the same thing. A vApp is a grouping of virtual machines in vSphere, for example a management appliance and a database appliance working together.

vShield Edge

A vShield Edge virtual appliance provides network edge security to protect the virtual machines in a vCloud tenant's network from attacks originating from the public network. The vShield Edge connects the isolated, private networks of cloud tenants to the public side of the service provider network through common edge services such as DHCP, VPN, NAT, and load balancing.

You install a vShield Edge from the vShield Manager. You can install one vShield Edge instance per tenant port group on a vNetwork Distributed Switch (vDS). You configure a vShield Edge by using REST API.

vShield Endpoint

vShield Endpoint offloads antivirus and anti-malware agent processing to a dedicated secure virtual appliance delivered by VMware partners. Since the secure virtual appliance (unlike a guest virtual machine) doesn't go offline, it can continuously update antivirus signatures thereby giving uninterrupted protection to the virtual machines on the host. Also, new virtual machines (or existing virtual machines that went offline) are immediately protected with the most current antivirus signatures when they come online.

vShield Data Security

vShield Data Security provides visibility into sensitive data stored within your organization's virtualized and cloud environments. Based on the violations reported by vShield Data Security, you can ensure that sensitive data is adequately protected and assess compliance with regulations around the world.

Compatibility Between Different REST API Versions

Each release of the vShield REST API represents a new version of the REST API code with new and changed features. If you are running a previous version of vShield component software, you might not be able to use all of the features of the latest release of the vShield REST API.

CAUTION The REST APIs described in this document can change over time. At this point, vShield does not guarantee forward compatibility.

REST API Version 2.0 in vShield 5.0

Release 5.0 of vShield introduces version 2.0 of the REST API. Many URLs changed from version 1.0 to 2.0.

You can determine the API version of a vShield component (such as Edge or App) with the following example REST calls. In the GET request syntax, <vsm-ip> represents the IP address or host name of vShield Manager.

Example 1-1. Determine the API version of the vShield Manager or vShield Endpoint

GET https://<vsm-ip>/api/versions
<versions>
  <version value="2.1">
    <module name="tingAppGlobal" baseUri="/api/2.1/app" version="2.1"/>
    <module name="Flow" baseUri="/api/2.1/app/flow" version="2.1"/>
  </version>
  <version value="2.0">
    <module name="Dlp" baseUri="/api/2.0/dlp" version="2.0"/>
    <module name="Endpoint" baseUri="/api/2.0/endpointsecurity" version="2.0"/>
    <module name="MACSet" baseUri="/api/2.0/services/macset" version="2.0"/>
    <module name="SystemEvent" baseUri="/api/2.0/systemevent" version="2.0"/>
    <module name="AuditLog" baseUri="/api/2.0/auditlog" version="2.0"/>
    <module name="Application" baseUri="/api/2.0/services/application" version="2.0"/>
    <module name="IPSet" baseUri="/api/2.0/services/ipset" version="2.0"/>
    <module name="SyslogServer" baseUri="/api/2.0/services/syslog/config" version="2.0"/>
<module name="SecurityGroup" baseUri="/api/2.0/services/securitygroup" version="2.0"/>
</version>
</versions>

CAUTION  In the response of this GET call, the module name EndpointSolution in 5.0 has changed to Endpoint in 5.0.1.
**Example 1-2.** Determine the API version of a vShield App

GET https://<vsm-ip>/api/versions/app/<datacenter-id>
<versions>
  <version version="2.0">
    <module version="2.0" baseUri="/api/2.0/app" id="datacenter-21" name="app"/>
  </version>
</versions>

**Example 1-3.** Determine the API version of a vShield Edge

GET https://<vsm-ip>/api/versions/edge/dvportgroup-63
<versions>
  <version version="2.0">
    <module version="2.0" baseUri="/api/2.0/networks" id="dvportgroup-63" name="edge"/>
  </version>
</versions>

The API version for vShield App is governed by the state of the datacenter in relation to a vShield component. If the datacenter state is in backwardCompatible mode, then it supports only version 1.0 REST calls. If the datacenter state is in regular mode, then it supports only 2.0 REST calls. These API versions are mutually exclusive – only one REST API version is supported at a time.

**Table 1-1.** REST API Compatibility Matrix

<table>
<thead>
<tr>
<th>REST API Version</th>
<th>vShield Manager Version</th>
<th>vShield Appliance Version</th>
<th>Supported?</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0</td>
<td>1.0</td>
<td>1.0</td>
<td>Yes</td>
</tr>
<tr>
<td>1.0</td>
<td>2.0</td>
<td>1.0</td>
<td>Yes, however, client cannot configure any new features in vShield Manager 2.0</td>
</tr>
<tr>
<td>1.0</td>
<td>2.0</td>
<td>2.0 Backward Mode¹</td>
<td>Yes, however, client cannot configure any new features in vShield Manager 2.0</td>
</tr>
<tr>
<td>2.0</td>
<td>2.0</td>
<td>1.0</td>
<td>No</td>
</tr>
<tr>
<td>2.0</td>
<td>2.0</td>
<td>2.0 Backward Mode</td>
<td>No</td>
</tr>
<tr>
<td>2.0</td>
<td>2.0</td>
<td>2.0</td>
<td>Yes</td>
</tr>
</tbody>
</table>

¹. If the vShield Edge is in Backward Mode, the vShield Manager does not accept REST 2.0 calls for vShield Edge configuration. You must switch the vShield Edge to Normal Mode. After a vShield Edge has been switched to Normal Mode, you cannot change to Backward Mode.

**Multitenancy**

In vShield 5.0, the vShield App firewall configuration supports multitenancy. A single IP address can show up in multiple places in the network (different IP address namespaces) associated with different virtual machines. Only 2.0 REST APIs support multitenancy. In backward compatibility mode, vShield 5.0 supports the old APIs and does not enforce rules with awareness of multitenancy.

If you have written programs using 1.0 REST APIs, you should reconsider whether their design works as intended in the multitenancy scenario. If not, change your programs to use the API 2.0 calls.

**An Introduction to REST API for vShield Users**

REST, an acronym for Representational State Transfer, is a term that has been widely employed to describe an architectural style characteristic of programs that rely on the inherent properties of hypermedia to create and modify the state of an object that is accessible at a URL.
How REST Works

Once a URL of such an object is known to a client, the client can use an HTTP GET request to discover the properties of the object. These properties are typically communicated in a structured document with an HTTP Content-Type of XML or JSON, that provides a representation of the state of the object. In a RESTful workflow, documents (representations of object state) are passed back and forth (transferred) between a client and a service with the explicit assumption that neither party need know anything about an entity other than what is presented in a single request or response. The URLs at which these documents are available are often “sticky,” in that they persist beyond the lifetime of the request or response that includes them. The other content of the documents is nominally valid until the expiration date noted in the HTTP Expires header.

IMPORTANT All vShield REST requests require authorization. The default vShield Manager login credentials are user admin password default. Unless you changed these, you can use the following basic authorization, where YWRtaW46ZGVmYXVsdA== is the Base 64 encoding of the default credentials admin:default.

Authorization: Basic YWRtaW46ZGVmYXVsdA==

Using the vShield REST API

You have several choices for programming the vShield REST API: using Firefox, Chrome, or curl. To make XML responses more legible, you can copy and paste them into xmlcopyeditor or pspad.

To use the REST API in Firefox

1 Locate the RESTClient Mozilla add-on, and add it to Firefox.
2 Click Tools > REST Client to start the add-on.
3 Click Login and enter the vShield login credentials, which then appear encoded in the Request Header.
4 Select a method such as GET, POST, or PUT, and type the URL of a REST API. You might be asked to accept or ignore the lack of SSL certificate. Click Send.

Response Header, Response Body, and Rendered HTML appear in the bottom window.

To use the REST API in Chrome

1 Search the Web to find the Simple REST Client, and add it to Chrome.
2 Click its globe-like icon to start it in a tab.
3 The Simple REST Client provides no certificate-checking interface, so use another Chrome tab to accept or ignore the lack of SSL certificate.
4 Type the URL of a REST API, and select a method such as GET, POST, or PUT.
5 In the Headers field, type the basic authorization line, as in the Important note above. Click Send.

Status, Headers, and Data appear in the Response window.

To use the REST API in curl

1 Install curl if not already installed.
2 In front of the REST URL, the -k option avoids certificate checking, and the -u option specifies credentials.

   
curl -k -u admin:default https://<vsm-ip>/api/2.0/services/usrmgmt/user/admin

Ports Required for vShield REST API

The vShield Manager requires port 443/TCP for REST API requests.
About the REST API

REST APIs use HTTP requests (often sent by script or high-level language) as a way of making idempotent remote procedure calls that create, modify, or delete objects defined by the API. A REST API is defined by a collection of XML documents that represent the objects on which the API operates. The HTTP operations themselves are generic to all HTTP clients. To write a RESTful client, you should understand HTTP protocol and the semantics of standard HTML markup. For vShield REST API, you must know three things:

- The set of objects that the API supports, and what they represent. For example, what are vDC and Org?
- How the API represents these objects. For instance, what is the XML schema for the vShield Edge firewall rule set? What do the individual elements and attributes represent?
- How the client refers to an object on which it wants to operate. For example, what is a managed object ID?

To answer these questions, you look at vShield API resource schemas. These schemas define a number of XML types, many of which are extended by other types. The XML elements defined in these schemas, along with their attributes and composition rules (minimum and maximum number of elements or attributes, or the prescribed hierarchy with which elements can be nested) represent the data structures of vShield objects. A client can “read” an object by making an HTTP GET request to the object’s resource URL. A client can “write” (create or modify) an object with an HTTP PUT or POST request that includes a new or changed XML body document for the object. Usually a client can delete an object with an HTTP DELETE request.

This document presents example requests and responses, and provides reference information on the XML schemas that define the request and response bodies.

RESTful Workflow Patterns

All RESTful workflows fall into a pattern that includes only two fundamental operations, which you repeat in this order for as long as necessary.

- Make an HTTP request (GET, PUT, POST, or DELETE). The target of this request is either a well-known URL (such as vShield Manager) or a link obtained from the response to a previous request. For example, a GET request to an Org URL returns links to vDC objects contained by the Org.
- Examine the response, which can be an XML document or an HTTP response code. If the response is an XML document, it may contain links or other information about the state of an object. If the response is an HTTP response code, it indicates whether the request succeeded or failed, and may be accompanied by a URL that points to a location from which additional information can be retrieved.

For More Information About REST

For a comprehensive discussion of REST from both client and server perspectives, see RESTful Web Services by Leonard Richardson and Sam Ruby, published 2007 by O’Reilly Media.

There are also many sources of information about REST on the Web, including:

- http://www.infoq.com/articles/rest-introduction
The vShield Manager requires communication with your vCenter Server and services such as DNS and NTP to provide details on your VMware Infrastructure inventory.

The chapter includes the following topics:

- “Synchronizing vShield Manager with vCenter Server and DNS” on page 17
- “Querying vShield Manager Configuration” on page 18
- “Registering vShield Manager Plug-In with vSphere Client” on page 19
- “Unregistering vShield Manager Plug-In with vSphere Client” on page 19
- “Querying Registration Status of vShield Manager Plug-In” on page 19
- “Monitoring vShield Manager reachability” on page 19
- “Working with vShield Manager Syslog Server Configuration” on page 19
- “Querying vShield Manager Logs” on page 20
- “Querying vShield Manager Tech Support Log” on page 21
- “User Management” on page 21
- “Role Management” on page 24
- “Creating IPset and MACset Containers” on page 25
- “Security Group Scope and Members” on page 28
- “Transport Set for Applications” on page 31

IMPORTANT All vShield REST requests require authorization. See “Using the vShield REST API” on page 15 for details about basic authorization.

Synchronizing vShield Manager with vCenter Server and DNS

You can synchronize the vShield Manager with the vCenter Server, add DNS servers to the vShield Manager for IP address and hostname resolution, configure time, and zone and add an NTP server. Synchronizing with vCenter Server enables the vShield Manager user interface to display your VMware Infrastructure inventory, and requires its IP address (or URL) and administrator login credentials. For the vcInfo schema, and the dnsInfo schema, see “vShield Manager Global Configuration Schema” on page 105.

Example 2-1. Synchronize the vShield Manager with vCenter server and identify DNS services

Request:

POST https://<vsm-ip>/api/2.0/global/config

Request Body:
<vsmGlobalConfig xmlns="vmware.vshield.edge.2.0">
  <vcInfo>
    <ipAddress>10.112.196.22</ipAddress>
    <userName>administrator</userName>
    <password>123</password>
  </vcInfo>
  <dnsInfo>
    <primaryDns>10.112.192.1</primaryDns>
    <secondaryDns>10.112.192.2</secondaryDns>
  </dnsInfo>
</vsmGlobalConfig>

Specifying DNS information is optional. You can synchronize vShield Manager with just vCenter Server.

**Example 2-2.** Synchronize the vShield Manager with vCenter Server

Request:
POST https://<vsm-ip>/api/2.0/global/config

Request Body:

```xml
<vsmGlobalConfig xmlns="vmware.vshield.edge.2.0">
  <vcInfo>
    <ipAddress>10.112.196.22</ipAddress>
    <userName>administrator</userName>
    <password>123</password>
  </vcInfo>
</vsmGlobalConfig>
```

**Example 2-3.** Configure time and zone

Request:
POST https://<vsm-ip>/api/2.0/global/config

Request Body:

```xml
<vsmGlobalConfig xmlns="vmware.vshield.edge.2.0">
  <timeInfo>
    <clock>2011-09-09 09:00:00</clock>
    <zone>Pacific</zone>
  </timeInfo>
</vsmGlobalConfig>
```

**Example 2-4.** Configure NTP server

Request:
POST https://<vsm-ip>/api/2.0/global/config

Request Body:

```xml
<vsmGlobalConfig xmlns="vmware.vshield.edge.2.0">
  <timeInfo>
    <ntpServer>10.112.196.2</ntpServer>
  </timeInfo>
</vsmGlobalConfig>
```

**Querying vShield Manager Configuration**

You can query the current vCenter, DNS, and time/zone or NTP server configuration for the vShield Manager.
Example 2-5. Get vShield Manager configuration

Request:
GET https://<vsm-ip>/api/2.0/global/config

Registering vShield Manager Plug-In with vSphere Client

You can register the vShield Manager as a vSphere Client plug-in.

Example 2-6. Register vShield Manager plug-in with vSphere client

Request:
PUT https://<vsm-ip>/api/2.0/global/viplugin/register?natedIp=<ip>&natedPort=<port>

Where ip and port are optional parameters that you may want to specify in a NAT environment.

Unregistering vShield Manager Plug-In with vSphere Client

You can unregister the vShield Manager as a vSphere Client plug-in.

Example 2-7. Unregister vShield Manager Plug-in with vSphere client

Request:
PUT https://<vsm-ip>/api/2.0/global/viplugin/unregister

Querying Registration Status of vShield Manager Plug-In

You can get the registration status of the vShield Manager as a vSphere Client plug-in.

Example 2-8. Get registration status of vShield Manager Plug-in with vSphere client

Request:
GET https://<vsm-ip>/api/2.0/global/viplugin/status

Monitoring vShield Manager reachability

You can verify that the vShield Manager is reachable.

Example 2-9. Verify that the vShield Manager is reachable

Request:
GET https://<vsm-ip>/api/2.0/global/heartbeat

Working with vShield Manager Syslog Server Configuration

You can configure vShield manager to send system events and audit logs to a syslog server, retrieve current configuration, or delete the current configuration.
Configure vShield Manager Syslog Server

You can configure vShield Manager to send logs to a syslog server. If a syslog server configuration exists, this call updates the configuration.

**Example 2-10. Configure vShield Manager syslog server**

Request:
PUT https://<vsm-ip>/api/2.0/services/syslog/config

Request Body:
```xml
<syslogServerConfig>
  <serverInfo>10.112.200.100:1000</serverInfo>
</syslogServerConfig>
```

Get vShield Manager Syslog Server Configuration

You can get the vShield Manager syslog server configuration.

**Example 2-11. Get vShield Manager syslog server configuration**

Request:
GET https://<vsm-ip>/api/2.0/services/syslog/config

Delete vShield Manager Syslog Server Configuration

You can delete the vShield Manager syslog server configuration.

**Example 2-12. Delete vShield Manager syslog server configuration**

Request:
DELETE https://<vsm-ip>/api/2.0/services/syslog/config

Querying vShield Manager Logs

You can retrieve vShield Manager system event and audit logs.

Get vShield Manager System Events

You can retrieve vShield Manager system events.

**Example 2-13. Get vShield Manager system events**

Request:
GET https://<vsm-ip>/api/2.0/systemevent?startIndex=0&pageSize=10

Where
- `startIndex` is an optional parameter which specifies the starting point for retrieving the logs. If this parameter is not specified, logs are retrieved from the beginning.
- `pageSize` is an optional parameter that limits the maximum number of entries returned by the API. The default value for this parameter is 256 and the valid range is 1-1024.
Get vShield Manager Audit Logs

You can get vShield Manager audit logs.

**Example 2-14. Get vShield Manager audit logs**

Request:

GET https://<vsm-ip>/api/2.0/logging/auditlog?startIndex=0\&pageSize=10

Where

- **startIndex** is an optional parameter which specifies the starting point for retrieving the logs. If this parameter is not specified, logs are retrieved from the beginning.
- **pageSize** is an optional parameter that limits the maximum number of entries returned by the API. The default value for this parameter is 256 and the valid range is 1-1024.

Querying vShield Manager Tech Support Log

You can get the path to the diagnostic log file for the vShield Manager. You can then send the diagnostic log to technical support for assistance in troubleshooting an issue.

**Example 2-15. Get Tech Support Log File Path for a vShield Manager**

Request:

GET https://<vsm-ip>/api/2.0/global/techSupportLogs

The technical support log is placed in a file at the following path, however the REST API has no provision for downloading it, and `wget` and `curl` do not have permission to download it, either. You can retrieve the log with vShield Manager by clicking **Settings & Reports > Configuration > Support > [Log Download] Initiate**.

/tech_support_logs/vsm/vshield_mgr_support_<date_time>GMT.log.gz

User Management

The authentication and authorization APIs include methods to manage users and roles.

Get a List of Users

You can retrieve a list of vShield Manager users, both local users and vCenter users who are assigned a role.

**Example 2-16. Get a list of users**

Request:

GET https://<vsm-ip>/api/2.0/services/usermgmt/users/vsm

Before you add users to vShield Manager, the pre-existing defaults are local user **admin** and the vCenter user **administrator**.

Get Information About a User

You can retrieve information about a user.

**Example 2-17. Get information about a user**

Request:
GET https://<vsm-ip>/api/2.0/services/usermgmt/user/<userId>

User information includes user name, full name, email address, whether local or not, whether enabled, resource objects, roles, and scope.

Create a Local User on vShield Manager

You can create a local vShield Manager user.

Example 2-18. Create a local user

Request Header:
POST https://<vsm-ip>/api/2.0/services/usermgmt/user/local

Request Body:
<userInfo>
  <userId>somebody</userId>
  <password>123</password>
  <fullname>Person Somebody</fullname>
  <email>ps@y.com</email>
  <accessControlEntry>
    <role>security_admin</role>
  </accessControlEntry>
</userInfo>

Update a Local User Account

You can update a local user account including password. If a password is not provided, the existing password is retained. The <userId> variable in the request header should be same as the one specified in XML. The API returns updated information for the user.

Example 2-19. Update a local user account

Request Header:
PUT https://<vsm-ip>/api/2.0/services/usermgmt/user/local/<userId>

Request Body:
<userInfo>
  <userId>somebody</userId>
  <password>123</password>
  <fullname>Person Somebody</fullname>
  <email>ps@y.com</email>
  <accessControlEntry>
    <role>security_admin</role>
    <resource><resourceId>datacenter-312</resourceId></resource>
  </accessControlEntry>
</userInfo>

Enable or Disable a User Account

You can disable or enable a user account, either local user or vCenter user. When a user account is created, the account is enabled by default.

Example 2-20. Enable or disable a user account

Request:
PUT https://<vsm-ip>/api/2.0/services/usermgmt/user/<userId>/enablestate/<value>

The <value> can be 0 (zero) to disable the account, or 1 (one) to enable the account.
This API returns “204 No Content” if successful.

**Remove a User Account**

The first API removes a local user account, or removes the VSM role assignment for a vCenter user, without affecting the vCenter account. The second API removes a vCenter user’s roles but is not allowed for local users.

**Example 2-21. Remove a user account**

Request:
DELETE https://<vsm-ip>/api/2.0/services/usermgmt/user/<userId>

**Example 2-22. Removing a user role**

Request:
DELETE https://<vsm-ip>/api/2.0/services/usermgmt/role/<userId>

Both APIs return “204 No Content” if successful.
Role Management

Get Role for a User
You can retrieve information about the role assigned to this user.

Example 2-23. Get user role

Request:
GET https://<vsm-ip>/api/2.0/services/usermgmt/role/<userId>

Possible roles are super_user, vshield_admin, enterprise_admin, security_admin, and auditor.

Add Role and Resources for a User
You can add role and accessible resources for the specified user. It affects only vCenter users, not local users. For local vShield Manager users, it displays the error “400: User already present.”

Example 2-24. Update user role

Request Header:
POST https://<vsm-ip>/api/2.0/services/usermgmt/role/<userId>

Request Body:
<accessControlEntry>
  <role>new_role</role>
  <resource>
    <resourceId>resource-num</resourceId>
    ...
  </resource>
</accessControlEntry>

This API returns “204 No Content” if successful.

Change User Role
You can update the role assignment for a given user. The API returns an output representation specifying a new <accessControlEntry> for the user.

Example 2-25. Change user role

Request Header:
PUT https://<vsm-ip>/api/2.0/services/usermgmt/role/<userId>

Request Body:
<accessControlEntry>
  <role>new_role</role>
  <resource>
    <resourceId>resource-num</resourceId>
    ...
  </resource>
</accessControlEntry>

Possible roles are super_user, vshield_admin, enterprise_admin, security_admin, and auditor.
Get List of Possible Roles
You can retrieve the possible roles in vShield Manager.

Example 2-26. Get possible roles

Request:
GET https://<vsm-ip>/api/2.0/services/usermgmt/roles

Get List of Scoping Objects
You can retrieve a list of objects that can be used to define a user's access scope.

Example 2-27. Get scoping objects

Request:
GET https://<vsm-ip>/api/2.0/services/usermgmt/scopingobjects

The scoping objects are usually managed object references or vCenter Server names of datacenters and folders.

Creating IPset and MACset Containers
You can create vShield containers based on IP addresses and MAC addresses. These APIs control two types of resources: vShield Manager scope object (a datacenter or portgroup) and the IPset or MACset addresses.

List IPsets Created on a Scope
You can retrieve all the IPsets that were created on the specified scope.

Example 2-28. List IPsets on a scope

Request:
GET https://<vsm-ip>/api/2.0/services/ipset/scope/<scope-moref>

The <scope-moref> can be a datacenter or portgroup of the vCenter to which vShield Manager is connected.

Create an IPset on a Scope
You can create a new IPset on the specified scope.

Example 2-29. Create IPset on a scope

Request:
POST https://<vsm-ip>/api/2.0/services/ipset/scope/<scope-moref>

Request Body Example:

```xml
<ipset>
  <objectld />
  <type>
  <typeName />
  </type>
  <description>
  New Description
  </description>
  <name>TestIPSet2</name>
  <revision>0</revision>
  <objectTypeName />
```
The `<scope>` can be a datacenter or portgroup of the vCenter to which vShield Manager is connected. In the request body example, a range of IP addresses on the 10.112 net is specified (201.8 to 201.14).

### Get Details of an IPset

You can retrieve details about an IPset.

**Example 2-30. Get details of an IPset**

Request:

GET https://<vsm-ip>/api/2.0/services/ipset/<ipset-id>

The `<ipset-id>` is as returned by listing the IPset on a scope.

### Modify an Existing IPset

You can modify an existing IPset and retrieve details about the modified IPset.

**Example 2-31. Modify an IPset**

Request:

PUT https://<vsm-ip>/api/2.0/services/ipset/<ipset-id>

Request Body Example:

```xml
<ipset>
  <objectId />
  <type>
    <typeName />
  </type>
  <description>New Description</description>
  <name>TestIPSet2</name>
  <revision>0</revision>
  <objectTypeName />
  <value>10.112.201.8-10.112.201.21</value>
</ipset>
```

The `<ipset-id>` is as returned by listing the IPset on a scope. In the request body example, the IP address range is doubled.

### Delete an IPset

You can delete an IPset. The trailing boolean flag indicates forced or unforced delete. With forced delete, the object is deleted even if used in other places such as firewall rules, causing invalid referrals. For unforced delete, the object is deleted only if it is not used by other configuration; otherwise the delete fails.

**Example 2-32. Delete an IPset**

Request:

DELETE https://<vsm-ip>/api/2.0/services/ipset/<ipset-id>

No input representation is needed. On success, this request returns 200 HTTP OK.
List MACsets Created on a Scope

You can retrieve all the MACsets that were created on the specified scope.

Example 2-33. List MACsets on a scope

Request:

GET https://<vsm-ip>/api/2.0/services/macset/scope/<scope-moref>

The <scope-moref> can be a datacenter or portgroup of the vCenter to which vShield Manager is connected.

Create a MACset on a Scope

You can create a MACset on the specified scope. On success, the API returns a string identifier for the new MACset.

Example 2-34. Create MACset on a scope

Request:

POST https://<vsm-ip>/api/2.0/services/macset/scope/<scope-moref>

Request Body Example:

```
<macset>
  <objectId />
  <type>
    <typeName />
  </type>
  <description>Some description</description>
  <name>TestMACSet1</name>
  <revision>0</revision>
  <objectTypeName />
</macset>
```

The <scope-moref> can be a datacenter or portgroup of the vCenter to which vShield Manager is connected. In the request body example, a comma-separated list of MAC addresses is specified.

Get Details of a MACset

You can retrieve details about a MACset.

Example 2-35. Get details of a MACset

Request:

GET https://<vsm-ip>/api/2.0/services/macset/<macset-id>

The <MACset-id> is as returned by listing the MACset on a scope.

Modify an Existing MACset

You can modify an existing MACset and retrieve details about the modified MACset.

Example 2-36. Modify details of a MACsets

Request:

PUT https://<vsm-ip>/api/2.0/services/MACset/<MACset-id>

Request Body Example:
The <MACset-id> is as returned by listing the MACset on a scope. In the request body example, one MAC address fewer is specified.

Delete a MACset

You can delete a MACset. The trailing boolean flag indicates forced or unforced delete. With forced delete, the object is deleted even if used in other places such as firewall rules, causing invalid referrals. For unforced delete, the object is deleted only if it is not used by other configuration; otherwise the delete fails.

Example 2-37. Delete a MACset

Request:
DELETE https://<vsm-ip>/api/2.0/services/macset/<macset-id>

No input representation is needed. On success, this request returns 200 HTTP OK.

Security Group Scope and Members

APIs are available for two types of resources:

- Scope – This identifies a vShield Manager scope object, which can either be a vCenter datacenter or a PortGroup (standard or distributed virtual switch). Security groups can only be created on valid scopes.
- Members – The security group object contains members.

List Security Groups Created on a Scope

You can retrieve all the security groups that have been created on a specific scope.

Example 2-38. Get existing security groups

Request:
GET https://<vsm-ip>/api/2.0/services/securitygroup/scope/<scope-moref>

The <scope-moref> could be the managed object reference of a datacenter.

Create Security Group on a Scope

You can create a new security group on the specified scope.

Example 2-39. Create new security group

Request:
POST https://<vsm-ip>/api/2.0/services/securitygroup/<scope-moref>

Example:
Get Members for a Scope

You can retrieve a list of applicable member elements that can be added to security groups created on a particular scope. Because security group allows only specific type of container elements to be added, this list helps you determine all possible valid elements that can be added.

**Example 2-40. Get members for a security group scope**

Request:

GET https://<vsm-ip>/api/2.0/services/securitygroup/scope/<scope-moref>/members/

Note that this API command requires a slash (/) at the end. The request returns a long output representation of member objects.

Get Security Group Details

You can retrieve the details about a security group.

**Example 2-41. Get details of a security group**

Request:

GET https://<vsm-ip>/api/2.0/services/securitygroup/<securitygroup-id>

Response Body:

```
<securitygroup>
  <objectId>securitygroup-1</objectId>
  <type>
    <typeName>SecurityGroup</typeName>
  </type>
  <name>sg-669123615</name>
  <revision>2</revision>
  <objectTypeName>SecurityGroup</objectTypeName>
  <scope>
    <id>datacenter-2</id>
    <objectTypeName>Datacenter</objectTypeName>
    <name>mydc</name>
  </scope>
  <inheritanceAllowed>false</inheritanceAllowed>
  <member>
    <objectId>vm-427</objectId>
    <type>
      <typeName>VirtualMachine</typeName>
    </type>
  </member>
</securitygroup>
```
Modify a Security Group
You can modify an existing security group.

Example 2-42. Modify a security group

Request:
PUT https://<vsm-ip>/api/2.0/services/securitygroup/<securitygroup-id>

Delete a Security Group
You can delete an existing security group. The `force=flag` indicates if the delete should be forced or unforced. With forced delete, the object is deleted even if used in other places such as firewall rules, causing invalid referrals. For unforced delete, the object is deleted only if it is not used by other configuration; otherwise the delete fails.

Example 2-43. Delete a security group

Request:
DELETE https://<vsm-ip>/api/2.0/services/securitygroup/<securitygroup-id>?force=<true|false>

No input representation is needed. On success, this request returns 200 HTTP OK.

Add Member to Security Group
You can add a new member to a security group.

Example 2-44. Add a member to a security group

Request:
PUT https://<vsm-ip>/api/2.0/services/securitygroup/<securitygroup-id>/members/<member-moref>

No input representation is needed. On success, this request returns 200 HTTP OK.

Delete Member from Security Group
This API removes a member from a security group.

Example 2-45. Delete member from a security group

Request:
DELETE https://<vsm-ip>/api/2.0/services/securitygroup/<securitygroup-id>/members/<member-moref>

No input representation is needed. On success, this request returns 200 HTTP OK.

Transport Set for Applications

The vShield transport set APIs are used to manipulate applications, and control two types of resources:

- Scope – identifies the scope of a vShield Manager object, which can be either a vSphere datacenter or a port group (legacy or dvPortgroup). Applications can be created only on valid scopes.
- Application – This is the main application object itself.

List Applications on a Scope

You can retrieve a list of applications that have been created on the scope specified by managed object reference <moref>.

Example 2-46. List applications on a given scope

Request:
GET https://<vsm-ip>/api/2.0/services/application/scope/<moref>

A non-existent scope results in a 400 Bad Request error.

Add Application to a Scope

You can create a new application on the specified scope.

Example 2-47. Add an application to a scope

Request:
POST https://<vsm-ip>/api/2.0/services/application/scope/<moref>

Request Body:

```
<application>
  <objectId/>
  <type>
    <typeName/>
  </type>
  <description>Some description</description>
  <name>TestApplication1</name>
  <revision>0</revision>
  <objectTypeName/>
  <element>
    <applicationProtocol>UDP</applicationProtocol>
    <value>9,22-31,44</value>
  </element>
</application>
```

For applicationProtocol, possible values are:

- TCP
- UDP
- ORACLE_TNS
- FTP
- SUN_RPC_TCP
- SUN_RPC_UDP
- MS_RPC_TCP
- MS_RPC_UDP
- NBNS_BROADCAST
- NBDG_BROADCAST

Only TCP and UDP support comma separated port numbers and dash separated port ranges. Other protocols support a single port number only.

On success, this call returns a string identifier for the newly created application, for instance Application-1. The location header in the reply contains the relative path of the created Application and can be used for further GET, PUT, and DELETE calls.

**Get Details of an Application**

You can retrieve details about the application specified by `<application-id>` as returned by the call shown in Example 2-47.

**Example 2-48. Retrieve details about an application**

Request:

GET https://<vsm-ip>/api/2.0/services/application/<application-id>

A non-existent application ID results in a 404 Not Found error.

**Modify Application Details**

You can modify the name, description, applicationProtocol, or port value of an application.

**Example 2-49. Modify application**

Request:

POST https://<vsm-ip>/api/2.0/services/application/<application-id>

Request Body:

```xml
<application>
  <objectId>Application-1</objectId>
  <type>
    <typeName>Application</typeName>
  </type>
  <description>Some description</description>
  <name>TestApplication</name>
  <revision>2</revision>
  <objectTypeName>Application</objectTypeName>
  <element>
    <applicationProtocol>TCP</applicationProtocol>
    <value>10,29-30,45</value>
  </element>
</application>
```

The call returns XML describing the modified application.

**Delete Application from Scope**

You can delete an application by specifying its `<application-id>`. The `force` flag indicates if the delete should be forced or unforced. For forced deletes, the object is deleted irrespective of its use in other places such as firewall rules, which invalidates other configurations referring to the deleted object. For unforced deletes, the object is deleted only if it is not being used by any other configuration. The default is unforced (false).
Example 2-50. Delete application

Request:

DELETE https://<vsm-ip>/api/2.0/services/application/<application-id>?force=<true|false>
ESX Host Preparation for vShield App, vShield Endpoint, and vShield Data Security

You can extend the capabilities of vShield by adding the following services: vShield App, vShield Endpoint, and vShield Edge. You must prepare each ESX host in your environment for these services. The vShield Manager OVA file contains the drivers and files necessary to install all additional services.

This chapter includes the following topics:

- “Installing Licenses for vShield Edge, vShield App, and vShield Endpoint” on page 35
- “Installing vShield App and vShield Endpoint Services on an ESX Host” on page 35
- “Installing vShield Data Security” on page 37
- “Upgrading vShield Data Security” on page 37
- “Getting the Installation Status of vShield Services on an ESX Host” on page 38
- “Uninstalling vShield Services from an ESX Host” on page 38
- “Uninstalling vShield Data Security” on page 38

IMPORTANT All vShield REST requests require authorization. See “Using the vShield REST API” on page 15 for details about basic authorization.

Installing Licenses for vShield Edge, vShield App, and vShield Endpoint

You must install licenses for vShield Edge, vShield App, and vShield Endpoint before installing these components. You can install these licenses by using the vSphere Client.

1. From a vSphere Client host that is connected to a vCenter Server system, select Home > Licensing.
2. For the report view, select Asset.
3. Right-click a vShield asset and select Change license key.
4. Select Assign a new license key and click Enter Key.
5. Enter the license key, enter an optional label for the key, and click OK.
6. Click OK.
7. Repeat these steps for each vShield component for which you have a license.

Installing vShield App and vShield Endpoint Services on an ESX Host

To shorten the time to deployment, you can install vShield App and vShield Endpoint services on an ESX host by using a single REST call. You can do this by including VszInstallParams and EpsecInstallParams in the POST body.
You must specify the host ID of the target ESX host to install all services.

See “ESX Host Preparation and Uninstallation Schema” on page 108.

**Example 3-1. Install a vShield App and vShield Endpoint on an ESX host**

Request

`POST https://<vsm-ip>/api/1.0/vshield/<host-id>`

Request Body

```xml
<VshieldConfiguration>
  <VszInstallParams>
    <DatastoreId>datastore-5035</DatastoreId>
    <ManagementPortSwitchId>network-4485</ManagementPortSwitchId>
    <MgmtInterface>
      <IpAddress>10.112.196.245</IpAddress>
      <NetworkMask>255.255.252.0</NetworkMask>
      <DefaultGw>10.112.199.253</DefaultGw>
    </MgmtInterface>
  </VszInstallParams>
  <EpsecInstallParams>true</EpsecInstallParams>
  <InstallAction>install</InstallAction>
</VshieldConfiguration>
```

ESX host preparation requires the following elements:

- **DatastoreId**: VC MOID of the datastore on which the vShield App service virtual machine files will be stored.
- **ManagementPortSwitchId**: VC MOID of the port group that will host the management port of the vShield App.
- **MgmtInterface**
  - **IpAddress**: IP address to be assigned to the management port of the vShield App. This IP address must be able to communicate with the vShield Manager.
  - **NetworkMask**: Subnet mask associated with the IP address assigned to the management interface of the vShield App.
  - **DefaultGw**: IP address of the default gateway.

After installation of all components is complete, do the following:

- **vShield App**: At this point, vShield App installation is complete. Each vShield App inherits global firewall rules set in the vShield Manager. The default firewall rule set allows all traffic to pass. You must configure blocking rules to explicitly block traffic. To configure App Firewall rules, see “Configuring Firewall Rules for vCenter” on page 60.
- **vShield Endpoint**: To complete installation, see “vShield Endpoint Management” on page 81.

You can install a single service by identifying only that service in the POST body. In **Example 3-2**, only vShield App is installed, as identified by inclusion of the VszInstallParams element only.

**Example 3-2. Install a vShield App only**

Request:

`POST https://<vsm-ip>/api/1.0/vshield/<host-id>/vsz`

Request Body:
Installing vShield Data Security

You can install vShield Data Security on a host that has vShield Endpoint installed.

Example 3-3. Install vShield Data Security on an ESX host

Request:

POST https://<vsm-ip>/api/1.0/vshield/<host-id>

Request Body:

```xml
<VshieldConfiguration>
    <VsdsInstallParams>
        <DatastoreId>datastore-5035</DatastoreId>
        <PortGroupId>network-12</PortGroupId>
        <MgmtInterface>
            <IpAddress>10.112.196.245</IpAddress>
            <NetworkMask>255.255.252.0</NetworkMask>
            <DefaultGw>10.112.199.253</DefaultGw>
        </MgmtInterface>
    </VsdsInstallParams>
    <InstallAction>install</InstallAction>
</VshieldConfiguration>
```

Where `<host-id>` is the MOID of the ESX host where vShield Data Security should be installed.

Upgrading vShield Data Security

You can upgrade vShield Data Security on a host without having to provide configuration parameters.

Example 3-4. Upgrade vShield Data Security on an ESX host

Request:

POST https://<vsm-ip>/api/1.0/vshield/<host-id>

Request Body:

```xml
<VshieldConfiguration>
    <VsdsInstallParams>
        </VsdsInstallParams>
    <InstallAction>upgrade</InstallAction>
</VshieldConfiguration>
```

Where `<host-id>` is the MOID of the ESX host where vShield Data Security should be upgraded.
Getting the Installation Status of vShield Services on an ESX Host

You can retrieve the installation or uninstallation status of vShield services on an ESX host to track progress as complete or not initiated. If neither of these operations is in progress, the response includes the list of installed services on the ESX host.

Example 3-5. Get vShield service installation status on an ESX host

Request:
GET https://<vsm-ip>/api/1.0/vshield/<host-id>

Uninstalling vShield Services from an ESX Host

You must unregister SVMs before uninstalling vShield Endpoint from the ESX host.

Example 3-6. Uninstall vShield Endpoint

Request:
DELETE https://<vsm-ip>/api/1.0/vshield/<host-id>/epsec

Example 3-7. Uninstall a vShield App only

Request:
DELETE https://<vsm-ip>/api/1.0/vshield/<host-id>/vsz

Uninstalling vShield Data Security

You can uninstall vShield Data Security on a host.

Example 3-8. Uninstall vShield Data Security

Request:
DELETE https://<vsm-ip>/api/1.0/vshield/<host-id>/vsds

Where <host-id> is the MOID of the ESX host where vShield Data Security should be deleted.
After ESX host preparation is complete, you can secure internal networks by installing a vShield Edge.

This chapter includes the following topics:

- “Installing a vShield Edge” on page 39
- “Querying vShield Edge Configuration” on page 40
- “Uninstalling a vShield Edge” on page 42

**IMPORTANT** All vShield REST requests require authorization. See “Using the vShield REST API” on page 15 for details about basic authorization.

### Installing a vShield Edge

You can install one vShield Edge per port group, vDS port group, or Cisco® Nexus 1000V. A vShield Edge requires an external port group with a physical NIC and an internal port group that contains the virtual machines to be secured. The vShield Edge sits inline between these port groups. If an internal port group does not exist, you must create this port group before installing a vShield Edge.

The vShield Edge installation API copies the vShield Edge OVF from the vShield Manager to the specified datastore and deploys a vShield Edge on the given port group. After the vShield Edge is installed, the virtual machine powers on and initializes according to the given network configuration.

Installing a vShield Edge instance adds a virtual machine to the vCenter Server inventory, which is mirrored in the vShield Manager user interface. You must specify an IP address for the management interface, and you may name the vShield Edge instance.

For the schema, see “vShield Edge Schemas” on page 116.

**Example 4-1. Install a vShield Edge**

Request:

```
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>>/edge
```

Request Body:

```
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <installParams>
    <resourcePoolId>resgroup-8</resourcePoolId>
    <hostId>host-9</hostId>
    <dataStoreId>datastore-11</dataStoreId>
  </installParams>
  <applianceConfig>
    <hostName>vShieldEdge-network-12</hostName>
    <networkId>network-12</networkId>
    <interface>
      <ipAddress>192.168.10.1</ipAddress>
      <subnetMask>255.255.255.0</subnetMask>
    </interface>
  </applianceConfig>
</vshieldEdgeConfig>
```
The installation schema requires the following values:

- **resourcePoolId**: Enter the VC MOID of the resource pool.
- **hostId**: Enter the VC MOID of the ESX Host to which the vShield Edge is to be cloned. Mandatory.
- **dataStoreId**: Enter the VC MOID of the Datastore to which the vShield Edge is to be cloned.
- **applianceConfig**: The interface should be defined twice, once with **isUplink**=true for the external interface, and once with **isUplink**=false or absent for the internal interface.

The installation schema accepts the following optional parameters for advanced configurations:

- **hostName**: This is the fully qualified domain name set on the vShield Edge virtual machine. It will be visible in the remote syslog messages generated from Edge.
- **tenantId**: Can be used to identify the tenant to which this Edge belongs. It will be visible in the remote syslog messages generated from Edge.
- **disableInternalFirewallRules**: This defaults to False. If set to true, the administrator needs to punch the required firewall holes to let the traffic generated from vShield Edge go out.
- **macAddress**: Can be used to add a vNIC with a specified MAC address. The user is responsible for validating the uniqueness of the MAC assignments on VC entities.
- **mtu**: The user can change the interface maximum transmission unit with this field. Default is 1500.
- **vmFolderId**: Specifies a particular folder on the VC where the Edge VM should be placed.
- **vseName**: Specifies host name of the Edge VM. Default is vshieldEdge-<internal-portgroup-on-vc>.
- **vmxParametersList**: These can be used to add configurations for the vNICs into the VMX file.
- **customField**: These can be used to define custom fields for the Edge VM.
- **memoryAllocation**: Changes memory allocation for the Edge VM, defining limits and/or reservation. Can be an absolute value (value) or a multiplier factor to the default value (multiplier). Default is 256 MB.
- **cpuAllocation**: Changes CPU allocation for the Edge VM, defining limits and/or reservation. Can be an absolute value (value) or a multiplier factor to the default value (multiplier).

---

**Querying vShield Edge Configuration**

You can get the full configuration present on a vShield Edge, including the list of configured services, such as DHCP, NAT, and firewall rules.

**Example 4-2.** Get current configuration of a vShield Edge

Request:

```
GET https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>>/edge
```

Example Configuration:
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
<installParams>
  <operationMode>routing</operationMode>
  <version>2.0</version>
  <resourcePoolId>resgroup-41</resourcePoolId>
  <hostId>host-27</hostId>
  <dataStoreId>datastore-28</dataStoreId>
  <vmId>vm-102</vmId>
  <applianceConfig>
    <hostName>vShieldEdge-dvportgroup-63</hostName>
    <disableInternalFirewallRules>false</disableInternalFirewallRules>
    <interface>
      <networkId>dvportgroup-63</networkId>
      <ipAddress>192.168.1.1</ipAddress>
      <subnetMask>255.255.255.0</subnetMask>
      <mtu>1500</mtu>
    </interface>
    <interface>
      <isUplink>true</isUplink>
      <networkId>network-23</networkId>
      <ipAddress>10.24.128.202</ipAddress>
      <subnetMask>255.255.252.0</subnetMask>
      <defaultGw>10.24.131.253</defaultGw>
      <mtu>1500</mtu>
    </interface>
  </applianceConfig>
  <vmFolderId>group-v3</vmFolderId>
</installParams>
<natConfig>
  <rule>
    <type>snat</type>
    <internalIpAddress>any</internalIpAddress>
    <externalIpAddress>10.24.130.250</externalIpAddress>
    <enableLog>false</enableLog>
  </rule>
</natConfig>
<firewallConfig>
  <defaultPolicy>deny</defaultPolicy>
  <enableLoggingForDefaultPolicy>false</enableLoggingForDefaultPolicy>
  <blockIcmpErrors>false</blockIcmpErrors>
  <rule>
    <networkId>dvportgroup-63</networkId>
    <protocol>tcp</protocol>
    <destinationPort>any</destinationPort>
    <sourcePort>any</sourcePort>
    <sourceIpAddress>192.168.0.0</sourceIpAddress>
    <direction>in</direction>
    <action>allow</action>
    <disabled>false</disabled>
  </rule>
  <rule>
    <networkId>network-23</networkId>
    <protocol>tcp</protocol>
    <destinationPort>any</destinationPort>
    <sourcePort>any</sourcePort>
    <sourceIpAddress>192.168.0.0</sourceIpAddress>
    <direction>in</direction>
  </rule>
</firewallConfig>
</vshieldEdgeConfig>
Uninstalling a vShield Edge

You can uninstall a vShield Edge appliance.

Example 4-3. Uninstall a vShield Edge

Request:

DELETE https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
You can manage vShield Edge services and firewall policies with the REST API. You can install Edge, post and delete configurations, and get status of various services.

This chapter includes the following topics:

- “Configuring vShield Edge” on page 43
- “Configuring Edge Services” on page 45
- “Operating vShield Edge” on page 56
- “Debugging and Support” on page 57

**IMPORTANT** All vShield REST requests require authorization. See “Using the vShield REST API” on page 15 for details about basic authorization.

### Configuring vShield Edge

The set of APIs in this section perform vShield Edge installation, configuration, and deletion.

### List vShield Edge Installations

This call returns a list of all the vShield Edge appliances installed by vShield Manager.

**Example 5-1. Get the vShield Edge installations**

**Request:**

GET https://<vsm-ip>/api/2.0/networks/edge/capability

For each vShield Edge, it shows capability for the VPN, load balancer, NAT, firewall, DHCP, and static routing. It says on what dvPortGroup the Edge is installed, the Edge version number, and compatibility mode.

### Determine API Version

This call determines the API version that the vShield Edge can process. If the Edge is working in backward compatible mode, only 1.0 version APIs are allowed. If the Edge is working in regular mode, only 2.0 version APIs are allowed. To start accepting 2.0 APIs, see “Switch to New API Version” on page 44.

**Example 5-2. Determine API version**

**Request:**

GET https://<vsm-ip>/api/versions/edge/<internal-portgroup-vc-moref-id>
Get Capabilities of a vShield Edge

This call returns capabilities of the vShield Edge installed on the specified portgroup. The <internal-portgroup-vc-moref-id> is the managed object reference of a network or dvPortGroup.

**Example 5-3. Get Capabilities of a vShield Edge**

Request:
GET https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge/capability

For the specified vShield Edge, it shows capability for the VPN, load balancer, NAT, firewall, DHCP, and static routing. It also shows the dvPortGroup’s ID, Edge version number, and compatibility mode.

Switch to New API Version

The vShield 4.1 REST calls (API version 1.0) work when vShield 5.0 (API 2.0) is in backward compatibility mode. In regular mode, after you enable API 2.0, the REST calls are not backward compatible. Note:

- Clients can continue to use REST 1.0 on their already installed Edges. New Edges can be also be installed and use REST 1.0, however new features are not available without using the REST 2.0 API.
- To use new features exposed in version 2.0 of the REST API, you must upgrade the vShield Edge (see “Request Sync or Upgrade” on page 56) and switch to the new API version (see Example 5-4 below).
- Once the switch is made, you cannot downgrade to (revert to) version 1.0 of the REST API.

This call shown in Example 5-4 switches the REST mode to latest, so REST 1.0 can no longer administer the vShield Edge associated with <internal-portgroup-vc-moref-id>. The compatibility mode switches from backward compatibility to regular.

**Example 5-4. Enable new API on vShield Edge**

Request:
PUT https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/enable

Get Full Configuration of a vShield Edge

This API is used to read the full configuration present on Edge.

The <internal-portgroup-vc-moref-id> is the managed object reference of a network or dvPortGroup.

**Example 5-5. Get capabilities of a vShield Edge**

Request:
GET https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge

The response body may include these service configuration tags: installParams, routeConfig, natConfig, firewallConfig, dhcpConfig, dhcpService, loadBalancerConfig, loadBalancerService, certificateStoreConfig, ipsecSiteToSiteConfig, ipsecSiteToSiteService, syslogServerConfig, among others.

Change Configuration of a vShield Edge

This call changes the configuration of a vShield Edge. The <internal-portgroup-vc-moref-id> is the managed object reference of a dvPortGroup. All services, or just one, can be configured using this call.

A vShield Edge license is required. Edge Basic license includes: Install, NAT, Firewall, DHCP, static routing. Edge Premium license handles: LoadBalancer, VPN.
If a service configuration tag is present, it means replace the configuration. If a service configuration tag's block is empty, it means delete the configuration. If a service configuration tag is absent, it means do not change anything, and hence the previous configuration for that service is retained as is.

**Example 5-6. Change configuration of a vShield Edge**

Request:
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge

Request Body: see examples below.

**Install vShield Edge**
The post call configures a vShield Edge, as describe in “Installing a vShield Edge” on page 39.

**Delete vShield Edge**
The delete call uninstalls vShield Edge, as described in “Uninstalling a vShield Edge” on page 42.

**Configuring Edge Services**

You configure Edge services such as NAT, Firewall, DHCP, static routing, Load Balancer, and VPN with the API shown in Example 5-6. The following request bodies show various configurations made on vShield Edge.

**IMPORTANT** When you configure a vShield Edge service, the service is started on the appliance. If you do not want the service running, you must stop the service using an appropriate system command.

**Configure DHCP**

vShield Edge provides DHCP service to bind assigned IP addresses to MAC addresses, helping to prevent MAC spoofing attacks. All virtual machines protected by a vShield Edge can obtain IP addresses dynamically from the vShield Edge DHCP service.

vShield Edge supports IP address pooling and one-to-one static IP address allocation based on the vCenter managed object ID (vmId) and interface ID (interfaceId) of the requesting client. All DHCP settings configured by REST requests appear under the vShield Edge > DHCP tab for the appropriate vShield Edge in the vShield Manager user interface and in vSphere Client plug-in.

vShield Edge DHCP service adheres to the following rules:

- Listens on the vShield Edge internal interface (non-uplink interface) for DHCP discovery.
- As stated above, vmId specifies the vc-moref-id of the virtual machine, and interfaceId specifies the index of the vNic for the requesting client. The hostName is an identification of the binding being created. This hostName is not pushed as the specified host name of the virtual machine.
- By default, all clients use the IP address of the internal interface of the vShield Edge as the default gateway address. To override it, specify defaultGw under the configParams Interface, per binding or per pool. The client's broadcast and subnetMask values are from the internal interface for the container network.
- configParams and its elements are optional.
- leaseTime can be infinite, or a number of seconds. If not specified, the default lease time is 1 day.
- Logging is disabled by default. To enable logging, add a <log /> element within the <dhcpConfig> block.

For the DHCP schema, see “vShield Edge Schemas” on page 116. Sample XML request body:

**Example 5-7. Configure DHCP service**

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
vShield API Programming Guide

46 VMware, Inc.

vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <dhcpConfig>
    <binding>
      <vmId>vm-21</vmId>
      <interfaceId>1</interfaceId>
      <hostName>DlpServer</hostName>
      <internalIpAddress>192.168.10.11</internalIpAddress>
      <configParams>
        <domainName>test.com</domainName>
        <primaryNameServer>10.112.0.1</primaryNameServer>
        <secondaryNameServer>10.112.0.2</secondaryNameServer>
      </configParams>
    </binding>
    <pool>
      <ipRange>192.168.10.2-192.168.10.10</ipRange>
      <configParams>
        <leaseTime>infinite</leaseTime>
      </configParams>
    </pool>
  </dhcpConfig>
</vshieldEdgeConfig>

Manage the DHCP Service

To start DHCP service, specify up. To stop DHCP service, specify down.

**Example 5-8. Start DHCP service**

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <dhcpService>up</dhcpService>
</vshieldEdgeConfig>

**Example 5-9. Stop DHCP service**

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <dhcpService>down</dhcpService>
</vshieldEdgeConfig>

Delete DHCP Configuration

**Example 5-10. Delete DHCP configuration**

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <dhcpConfig/>
</vshieldEdgeConfig>

Configure Firewall

The vShield Edge provides firewall protection for incoming and outgoing sessions. In addition to the default firewall policy, you can configure a set of rules to allow or deny traffic sessions to and from specific sources and destinations. You manage the default firewall policy and firewall rules together for each vShield Edge agent. You must specify both firewall rules and defaultPolicy together whenever modifying either of them, or else the one you do not specify will be deleted.

Firewall rules for a vShield Edge configured by using REST requests appear under the vShield Edge > Firewall tab for the appropriate vShield Edge in the vShield Manager user interface and in the vSphere Client plug-in.

For the Edge firewall schema, see “vShield Edge Schemas” on page 116. Sample XML request body:
Example 5-11. Configure firewall

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
<firewallConfig>
    <defaultPolicy>deny</defaultPolicy>
    <enableLoggingForDefaultPolicy>false</enableLoggingForDefaultPolicy>
    <blockIcmpErrors>false</blockIcmpErrors>
    <rule>
        <networkId>network-12</networkId>
        <protocol>icmp</protocol>
        <icmpType>address-mask-reply</icmpType>
        <sourceIpAddress>
            <ipAddress>any</ipAddress>
        </sourceIpAddress>
        <destinationIpAddress>
            <ipAddress>10.112.2.150</ipAddress>
        </destinationIpAddress>
        <direction>out</direction>
        <sourcePort>any</sourcePort>
        <destinationPort>any</destinationPort>
        <action>deny</action>
        <enableLog>true</enableLog>
        <disabled>false</disabled>
    </rule>
</firewallConfig>
</vshieldEdgeConfig>

After this firewall configuration, the administrator can define firewall rules on internal or external (using the dvPortgroup’s managed object ID), or on the vpnInterface of the Edge. Rules can be defined using IPSet and Applications Grouping Objects defined on the appropriate scope. Notes:

- You can add multiple firewall rules by entering multiple <rule></rule> sections in the body.
- The vpnInterface is the external public address of the VPN.
- For <protocol> options tcp and udp, you must specify sourcePort and destinationPort elements. For options icmp and any, the sourcePort and destinationPort elements are not expected. Other protocol options include igmp, ipencap, rsvp, gre, l2tp, sctp, and ipv6. Also you have the flexibility to provide a new protocolName if the protocol is not listed by name in the <protocol> tag.
- You must add <icmpType> if you configure icmp as the protocol.
- Logging is disabled by default. To enable it, add <enableLog> true element within the <rule> section.
- The sourceIpAddress and destinationIpAddress can be entered in one of these formats:
  - <ipAddress> specified as a single IP address, a hyphen-separated IP address range (for example, 192.168.10.1-192.168.10.2555) or a subnet in CIDR notation (198.168.10.1/24)
  - the keyword any
  - an <ipSetIdentifier>, the managed object ID of an IPSet
- The sourcePort and destinationPort parameters can be entered in one of the following formats: the keyword any, the port number as an integer, or a range of port number, for example portX–portY.
- An applicationIdentifier from Grouping Objects can replace the destination port and protocol.
- The disabled parameter means to remember the rule on vShield Manager but not push the rule onto the Edge appliance. This is optional and defaults to false (push to appliance).
- The blockIcmpErrors parameter is advanced configuration. It is optional and defaults to false.

Change Firewall Rule to Allow

This deletes previously configured firewall rules and sets allow as the default policy.
**Example 5-12.** Set firewall policy to allow all

```
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <firewallConfig>
    <defaultPolicy>allow</defaultPolicy>
  </firewallConfig>
</vshieldEdgeConfig>
```

**Revert Firewall to Default**

This returns the firewall to default configuration (deny) by deleting existing rules.

**Example 5-13.** Reset firewall to defaults

```
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <firewallConfig />
</vshieldEdgeConfig>
```

**Create Firewall Rule with IPset or applicationSet**

To get the ID of the IPset or applicationSet, see Example 2-28, “List IPsets on a scope,” on page 25 or Example 2-46, “List applications on a given scope,” on page 31.

If the referenced IPset or applicationSet is deleted, the rule will be disabled on the Edge appliance.

The default policy in effect is to deny. The example below sets it to allow based on two rules.

**Example 5-14.** IPset or applicationSet based firewall rule

```
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <firewallConfig>
    <defaultPolicy>allow</defaultPolicy>
    <enableLoggingForDefaultPolicy>false</enableLoggingForDefaultPolicy>
    <blockIcmpErrors>false</blockIcmpErrors>
    <rule>
      <networkId>network-12</networkId>
      <applicationIdentifier>application-20</applicationIdentifier>
      <destinationIpAddress>
        <ipAddress>10.112.2.49</ipAddress>
      </destinationIpAddress>
      <sourcePort>any</sourcePort>
      <sourceIpAddress>
        <ipSetIdentifier>ipset-2</ipSetIdentifier>
      </sourceIpAddress>
      <direction>in</direction>
      <action>allow</action>
      <enableLog>false</enableLog>
      <disabled>false</disabled>
      <comments>Used IpSet</comments>
    </rule>
    <rule>
      <networkId>network-12</networkId>
      <protocol>icmp</protocol>
      <icmpType>address-mask-reply</icmpType>
      <destinationIpAddress>
        <ipAddress>10.112.2.150</ipAddress>
      </destinationIpAddress>
      <sourceIpAddress>
        <ipAddress>any</ipAddress>
      </sourceIpAddress>
      <direction>out</direction>
      <action>deny</action>
      <enableLog>true</enableLog>
    </rule>
</vshieldEdgeConfig>
```
Delete Firewall Configuration

**Example 5-15. Delete firewall rules**

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <firewallConfig/>
</vshieldEdgeConfig>

After removing a firewall configuration, the default policy that will be in effect is Deny.

Configure Static Routing

This uses the next-hop method for the outgoing interface. Attribute networkId specifies the managed object ID of the network, attribute network designates the IP address range, and nextHop the static route.

**Example 5-16. Configure static route**

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <routeConfig>
    <staticRoute>
      <networkId>network-12</networkId>
      <network>192.168.30.0/24</network>
      <nextHop>192.168.10.253</nextHop>
    </staticRoute>
  </routeConfig>
</vshieldEdgeConfig>

For the data path to work, you need to change the default firewall policy to ALLOW, or punch Firewall rules to allow data traffic on external and internal interfaces.

Delete the Static Routing

**Example 5-17. Delete static route**

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <routeConfig>
    <staticRoute/>
  </routeConfig>
</vshieldEdgeConfig>

Configure NAT

The vShield Edge provides network address translation (NAT) service to protect the IP addresses of internal (private) networks from the public network. You can configure NAT rules to provide access to services running on privately addressed virtual machines. There are two types of NAT rules that can be configured: SNAT and DNAT. When you post a NAT configuration, all the rules (both SNAT and DNAT) must be posted together. Otherwise, only the posted rules are retained, and unposted rules are deleted.

All SNAT and DNAT rules configured by using REST requests appear under the vShield Edge > NAT tab for the appropriate vShield Edge in the vShield Manager user interface and in the vSphere Client plug-in.

For the NAT schema, see “vShield Edge Schemas” on page 116. Sample XML request body:
Example 5-18. Configure NAT service

```
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge

<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <natConfig>
    <rule>
      <type>snat</type>
      <internalIpAddress>192.168.10.11</internalIpAddress>
      <externalIpAddress>10.112.2.146</externalIpAddress>
      <enableLog>false</enableLog>
    </rule>
    <rule>
      <type>dnat</type>
      <protocol>tcp</protocol>
      <internalIpAddress>192.168.10.2-192.168.10.12</internalIpAddress>
      <internalPort>any</internalPort>
      <externalIpAddress>10.112.2.146</externalIpAddress>
      <externalPort>any</externalPort>
      <enableLog>true</enableLog>
    </rule>
  </natConfig>
</vshieldEdgeConfig>
```

For the data path to work, you need to change the default firewall policy to ALLOW, or punch Firewall rules to allow data traffic on external and internal interfaces.

Rules:

- For `<protocol>` options tcp and udp, you must specify `sourcePort` and `destinationPort` elements. For options icmp and any, the `sourcePort` and `destinationPort` elements are not expected.
- You must add `<icmpType>` if you configure `icmp` as the protocol.
- The `externalIpAddress` and `internalIpAddress` elements can be entered in either of these methods:
  - `<ipAddress>` specified as a single IP address, a hyphen-separated IP address range (for example, 192.168.10.1-192.168.10.2555) or a subnet in CIDR notation (198.168.10.1/24).
  - the keyword any
- The `externalPort` and `internalPort` parameters can be entered in one of the following formats: the keyword any, the port number as an integer, or a range of port number, for example `portX-portY`.
- You can add multiple SNAT rules by entering multiple `<type>snat</type>` sections in the body.
- SNAT does not support `port` or `protocol` parameters.
- Logging is disabled by default. To enable logging, add an `<enableLog>` element set to true.

Delete NAT Configuration

To delete NAT configuration, post an empty rule set.

Example 5-19. Delete NAT rules

```
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge

<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <natConfig/>
</vshieldEdgeConfig>
```
Configure Load Balancer

The vShield Edge provides load balancing for HTTP traffic. Load balancing (up to Layer 7) enables Web application auto-scaling. To implement load balancing, you map an external (or public) IP address to a set of internal servers. The load balancer accepts HTTP requests on the external IP address and decides which internal server to use. Port 80 is the default listening port for load balancer service.

All Load Balancer settings configured by using REST requests appear under the vShield Edge > Load Balancer tab for the appropriate vShield Edge in the vShield Manager user interface and in the vSphere Client plug-in.

For the load balancer schema, see “vShield Edge Schemas” on page 116. Sample XML request body:

Example 5-20. Configure load balancer

```
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <loadbalancerConfig>
    <listener>
      <externalIpAddress>10.112.2.148</externalIpAddress>
      <backEndServerConfig>
        <ipAddress>192.168.10.11</ipAddress>
        <port>80</port>
      </backEndServerConfig>
      <algorithm>ip-hash</algorithm>
      <enableLog>false</enableLog>
    </listener>
  </loadbalancerConfig>
</vshieldEdgeConfig>
```

For the data path to work, you need to change the default firewall policy to ALLOW, or punch Firewall rules to allow data traffic on external and internal interfaces. Rules:

- You can map a global or public IP address to a set of internal servers for load balancing. The load balancer accepts HTTP requests on the <ipAddress> specified. If <port> is not given, 80 is the default port.
- The <backEndServerConfig> is a list of one or more IP addresses representing servers to use for load balancing.
- vShield Manager processes the posted XML file as a complete set of load balancing servers for the network specified. The current set of load balancing servers for a network is replaced with this new set of servers.
- You can add multiple servers as listeners by entering multiple <listener> sections in the body.
- You can configure the algorithm that is used to determine load balancing. The optional <algorithm> element can be set to round-robin (the default) or ip-hash.
- Logging is disabled by default. To enable logging, add a <enableLog> element set to true.

Manage Load Balancer Service

Example 5-21. Start load balancer

```
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <loadbalancerService>up</loadbalancerService>
</vshieldEdgeConfig>
```

Example 5-22. Stop load balancer

```
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <loadbalancerService>down</loadbalancerService>
</vshieldEdgeConfig>
```
Delete Load Balancer Configuration

Example 5-23. Delete load balancer configuration

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <loadbalancerConfig/>
</vshieldEdgeConfig>

Miscellaneous

You also use the Edge POST call to reconfigure IP interfaces, change credentials, and start remote logging.

Reconfigure Edge Interfaces

Example 5-24. Reconfigure IP interfaces

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <applianceConfig>
    <hostName>vShieldEdge-network-12</hostName>
    <interface>
      <networkId>network-12</networkId>
      <ipAddress>192.168.10.12</ipAddress>
      <subnetMask>255.255.255.0</subnetMask>
      <mtu>1500</mtu>
    </interface>
    <interface>
      <isUplink>true</isUplink>
      <networkId>network-13</networkId>
      <ipAddress>10.112.2.151</ipAddress>
      <subnetMask>255.255.254.0</subnetMask>
      <defaultGw>10.112.3.253</defaultGw>
      <mtu>2000</mtu>
    </interface>
  </applianceConfig>
</vshieldEdgeConfig>

You cannot change the macAddress or the portGroup of the interface that is currently attached.

Set vShield Edge Credentials

Example 5-25. Set vShield Edge credentials

<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <cliLoginCredentials>
    <username>test</username>
    <password>new-secret</password>
  </cliLoginCredentials>
</vshieldEdgeConfig>

Configure Remote Logging

You can configure a remote syslog server for vShield logging at the designated IP address. A maximum of two IP addresses can be configured.

Example 5-26. Configure remote logging

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <syslogServerConfig>
    <ipAddress>10.112.2.149</ipAddress>
  </syslogServerConfig>
</vshieldEdgeConfig>
Configure VPN

vShield Edge agents support site-to-site IPsec VPN between an Edge appliance and remote sites. On both ends, static one-to-one NAT is required for the VPN address. vShield Edge agents support pre-shared key mode, x/5-0 Certificate mode, IP unicast traffic, and no dynamic routing protocol between the Edge and remote VPN routers. Behind each remote VPN router, you can configure multiple subnets to connect the internal network behind a vShield Edge through IPSec tunnels. Subnets and the internal network behind vShield Edge must have non-overlapping address ranges.

You can deploy a vShield Edge agent behind a NAT device, which translates the Edge agent’s VPN address into a public accessible address facing the Internet; remote VPN routers use this public address to access the vShield Edge. Remote VPN routers can be located behind a NAT device as well. You must provide both the VPN native address and the NAT public address to set up the tunnel.

All VPN settings configured by using REST requests appear under the vShield Edge > VPN tab for the appropriate vShield Edge in the vShield Manager user interface and in the vSphere Client plug-in.

For the VPN schema, see “vShield Edge Schemas” on page 116. Sample XML request body:

Example 5-27. Configure a VPN

```xml
<ipsecSiteToSiteConfig xmlns="vmware.vshield.edge.2.0">
  <globalConfig>
    <id>10.112.2.50</id>
    <ipAddress>10.112.2.50</ipAddress>
    <enableLog>false</enableLog>
  </globalConfig>
  <siteConfig>
    <peerName>site1</peerName>
    <peerId>site1</peerId>
    <peerIpAddress>10.112.2.145</peerIpAddress>
    <localSubnet>192.168.10.0/24</localSubnet>
    <peerSubnet>192.168.20.0/24</peerSubnet>
    <authenticationMode>psk</authenticationMode>
    <preSharedKey>test</preSharedKey>
    <encryptionAlgorithm>3des</encryptionAlgorithm>
    <enablePfs>true</enablePfs>
    <dhGroup>dh2</dhGroup>
  </siteConfig>
</ipsecSiteToSiteConfig>
</vshieldEdgeConfig>
```

For the data path to work, you need to change the default firewall policy to allow or punch Firewall rules to allow data traffic on VPN and internal interfaces. Rules:

- The <id> is a unique ID used by all peers to identify this vShield Edge VPN gateway. In the example, it is the same as <ipAddress>.
- Similar to the preSharedKey in siteConfig, the optional preSharedKeyForDynamicIpSites in globalConfig is a pre-shared key for use by all peers when connecting with an unknown IP address.
- The <peerName> a descriptive name of the peer.
- The <peerId> is an ID to uniquely identify the peer, used to define policies for the peer and for peer authentication. For peers using certificate authentication, this ID must be the common name in the peer’s certificate. For PSK peers, this ID can be any string, but ideally the public IP address of the VPN or the FQDN for the VPN service.
The `<peerIpAddress>` can be any, or an actual IP address. If any, then this side can be a responder only, waiting for the peer to initiate connection. The `preSharedKeyForDynamicIPSites` (see above) must be configured in order to match a peer from “any” `<peerIpAddress>`, and all peers from “any” must be configured to share the global pre-shared key. If an IP address is specified, the address should be the peer’s public address that the vShield Edge can reach to make connection. This address is also required to create the site-level pre-shared key secret entry for this site.

The `<encryptionAlgorithm>` can be 3des, aes, or aes256.

If `<enablePfs>` is set true, Perfect Forward Secrecy (PFS) is enabled. In IPsec negotiations, PFS ensures that each new cryptographic key is unrelated to any previous key. The default is true (enabled). You must enable or disable PFS on both the tunnel peers, otherwise the IPsec tunnel cannot be established.

The `<dhGroup>` can be dh2 (the default) or dh5. This is needed to support VPN across vendors. DH means Diffie-Hellman, a public-key cryptography scheme that allows two parties to establish a shared secret over an insecure communications channel.

Logging is disabled by default. To enable logging, add an `<enableLog>` element set to true.

VPN service requires encryption. Specify the `<encryptionAlgorithm>` element as either 3des or aes.

Manage VPN Service

Example 5-28. Start VPN service

```
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <ipsecSiteToSiteService>up</ipsecSiteToSiteService>
</vshieldEdgeConfig>
```

Example 5-29. Stop VPN service

```
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <ipsecSiteToSiteService>down</ipsecSiteToSiteService>
</vshieldEdgeConfig>
```

Delete the VPN Configuration

Example 5-30. Delete VPN configuration

```
POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <ipsecSiteToSiteConfig/>
</vshieldEdgeConfig>
```

Generate Certificate Signing Request (CSR)

You can generate a CSR for vShield Edge. A certificate is required to configure VPN in authentication mode.

Example 5-31. Generate CSR

```
Request:

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge/csr

Sample Request Body:

<vshieldEdgeConfig xmlns:xs="http://www.w3.org/2001/XMLSchema" xmlns="vmware.vshield.edge.2.0">
  <certificateStoreConfig>
    <csrParams>
      <commonName>up.example.com</commonName>
      <organization>Example Inc</organization>
    </csrParams>
  </certificateStoreConfig>
</vshieldEdgeConfig>
```
The call returns a CSR, which you send to the certifying authority (CA), who returns a security certificate.

**Add X.509 Certificate as VPN Site**

1. Generate a certificate signing request (CSR).
2. Have the CSR certified by a certificate authority (CA). Also get the certificate of this CA (caCertificate).
3. Upload the caCertificate and the vShield Edge certificate.

**Example 5-32. Upload security certificates**

```xml
POST https://<vsm-ip>/api/2.0/networks/<network-ID>/edge
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <certificateStoreConfig>
    <caCertificate>...enter_text_here...</caCertificate>
    <certificate>...enter_text_here...</certificate>
  </certificateStoreConfig>
</vshieldEdgeConfig>
```

4. When using x.509 authentication mode, the globalConfig should have certificateCn specified.
5. Add the site configuration to an existing site with this request body.

**Example 5-33. Add site certificates**

```xml
<vshieldEdgeConfig xmlns="vmware.vshield.edge.2.0">
  <ipsecSiteToSiteConfig>
    <globalConfig>
      <id>10.112.2.50</id>
      <certificateCn>up.vmware.com</certificateCn>
      <ipAddress>10.112.2.50</ipAddress>
      <enableLog>false</enableLog>
    </globalConfig>
    <siteConfig>
      <peerName>site1</peerName>
      <peerId>site1</peerId>
      <peerIpAddress>10.112.2.145</peerIpAddress>
      <localSubnet>192.168.10.0/24</localSubnet>
      <peerSubnet>192.168.20.0/24</peerSubnet>
      <authenticationMode>psk</authenticationMode>
      <preSharedKey>test</preSharedKey>
      <encryptionAlgorithm>3des</encryptionAlgorithm>
      <enablePfs>true</enablePfs>
      <dhGroup>dh2</dhGroup>
    </siteConfig>
    <siteConfig>
      <peerName>site2</peerName>
      <peerId>up.vmware.com</peerId>
      <peerIpAddress>10.112.2.148</peerIpAddress>
      <localSubnet>192.168.30.0/24</localSubnet>
      <peerSubnet>192.168.40.0/24</peerSubnet>
      <authenticationMode>x.509</authenticationMode>
      <encryptionAlgorithm>aes</encryptionAlgorithm>
      <mtu>1500</mtu>
    </siteConfig>
  </ipsecSiteToSiteConfig>
</vshieldEdgeConfig>
```
For the data path to work, you need to change the default firewall policy to allow, or punch Firewall rules to allow data traffic on VPN and internal interfaces.

Operating vShield Edge

The set of APIs in this section perform vShield Edge discovery and operations.

Get Details About Edge

You can retrieve the details of a vShield Edge configuration. This shows the internal rules punched through the vShield Edge to make load balancing and VPN work.

Example 5-34. Retrieve vShield Edge details

Request:

GET https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge/details

This returns the current and install-time hostId, dataStoreId, vmId, and other details that give administrators insight into whether the Edge VM got vMotioned or altered.

Request Sync or Upgrade

You can synchronize or upgrade vShield Edge.

Example 5-35. Request an action from vShield Edge

Request:

POST https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge?action=<actiontype>

The <...moref-id> refers to some network entity. The <actiontype> can be one of the following:

- forcesync – force Edge to synchronize with the last good configuration in the vShield Manager database.
  
  POST https://<vsm-ip>/api/2.0/networks/dvportgroup-63/edge?action=forcesync

- upgrade – upgrade the Edge to the latest version if the OVF is available.
  
  POST https://<vsm-ip>/api/2.0/networks/dvportgroup-63/edge?action=upgrade

- forceupgrade – upgrade to the latest available version, creating one if an existing Edge is not found.
  
  POST https://<vsm-ip>/api/2.0/networks/dvportgroup-63/edge?action=forceupgrade

Get IPsec Tunnel Statistics

You can retrieve statistics about the IPsec tunnel.

Example 5-36. Get IPsec statistics

Request:

GET https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge/statistics/ipsec

Get DHCP Statistics

You can retrieve DHCP lease statistics, including details about leased IPs from the configured IP Pools.
Example 5-37. Get DHCP statistics

Request:
GET https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge/statistics/dhcp

Network Interface Statistics

You can retrieve traffic status, including external and internal interfaces, per interface, VPN to remote subnets, vShield Edge traffic processed, and dropped counters due to user-configured firewall rules.

Example 5-38. Get traffic statistics

Request:
GET https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge/statistics/interface

Get Service Status

You can retrieve the status of various services, where <svc> could be:

- dhcp – returns status of DHCP service, up or down depending on the Edge appliance's DHCP daemon.
  GET https://<vsm-ip>/api/2.0/networks/dvportgroup-63>/edge/dhcp/service
- vpn – returns status of VPN service, up or down depending on the Edge appliance's VPN daemon.
  GET https://<vsm-ip>/api/2.0/networks/dvportgroup-63>/edge/vpn/service
- loadbalancer – returns status of load balancer service, depending on the Edge appliance's daemon.
  GET https://<vsm-ip>/api/2.0/networks/dvportgroup-63>/edge/loadbalancer/service

Example 5-39. Get service status

Request:
GET https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge/<svc>/service

Debugging and Support

To help with your own debugging and to provide information for VMware technical support, APIs are available to retrieve vShield logs and get statistics about Edge services.

Retrieve Technical Support Log

This call provides the technical support logs from vShield Edge. These are often required for debugging purposes. The call returns the location where the compressed log files are downloaded.

Example 5-40. Get support logs

Request:
GET https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge/techSupportLogs

The technical support log is placed in a file, however the REST API has no provision for downloading it, and wget and curl do not have permission to download it, either. You can retrieve the log with vShield Manager by clicking Settings & Reports > Configuration > Support > [Log Download] Initiate.
**Get Service Statistics**

You can retrieve the vShield Edge service statistics. These are often required for debugging purposes. The call return the location where the service statistics text file is downloaded.

**Example 5-41. Get service statistics**

Request:

GET https://<vsm-ip>/api/2.0/networks/<internal-portgroup-vc-moref-id>/edge/serviceStats
You can configure vShield App firewall rules and syslog service by using REST API calls.

This chapter includes the following topics:
- “Modifying the State of a Datacenter” on page 59
- “Configuring Firewall Rules for vCenter” on page 60
- “Configuring the vShield App Firewall” on page 60
- “Configuring Fail-Safe Mode for vShield App Firewall” on page 70
- “Working with SpooGuard” on page 71
- “Working with Namespaces” on page 72
- “Excluding Virtual Machines from vShield App Protection” on page 77
- “Configuring Syslog Service for a vShield App” on page 78
- “Synchronizing vShield App” on page 78
- “Querying vShield App Technical Support Log” on page 79
- “Upgrading vShield App” on page 79

IMPORTANT All vShield REST requests require authorization. See “Using the vShield REST API” on page 15 for details about basic authorization.

Modifying the State of a Datacenter

The state of a datacenter is determined by the version of the vShield Manager on that datacenter. For a 5.0 vShield Manager, the datacenter is in the regular state which means only the 5.0 API calls are supported.

When the vShield Manager on a datacenter is upgraded from a previous release, the datacenter is in the backwardCompatible mode which means that only the APIs from the previous release are supported. When the vShield App components on that datacenter are upgraded to 5.0, the datacenter state is automatically changed from backwardCompatible to backwardCompatibleReadyForSwitch. This means that the vShield App components are running in backward compatible mode, so only the APIs from the previous release are supported.

When the datacenter is in the backwardCompatibleReadyForSwitch state, you can switch the datacenter state. While data from the old vShield App is being migrated to the 5.0 vShield App, the datacenter is in the migrating state. Once the data migration is complete, the datacenter state switches automatically to regular.

Retrieve Datacenter State

You can retrieve the state of the datacenter.
Example 6-1. Retrieve the datacenter state

Example:

GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-2/state

The XML response represents the DatacenterState object, containing an enumeration of datacenter status. The state could be regular, upgrading, migrating, backwardCompatible, or backwardCompatibleReadyForSwitch.

Modify Datacenter State

You can change the state of a datacenter only if it is in the backwardCompatibleReadyForSwitch state.

Example 6-2. Change datacenter state to migrating

Example:

POST https://<vsm-ip>/api/2.0/app/firewall/datacenter-2/state

Configuring Firewall Rules for vCenter

The primary function of a vShield App is to provide firewall protection on an ESX host by inspecting each session and returning details to the vShield Manager. Traffic details include sources, destinations, direction of sessions, applications, and ports being used. Traffic details can be used to create firewall allow or deny rules.

In the vShield Manager user interface or vSphere Client plug-in, the App Firewall tab contains the firewall rules enforced by vShield App instances. You can manage App Firewall rules at the datacenter, cluster, and port group levels to provide a consistent set of rules across multiple vShield App instances. As membership in these containers can change dynamically, App Firewall maintains the state of existing sessions without requiring reconfiguration of firewall rules. In this way, App Firewall effectively has a continuous footprint on each ESX host under the managed containers.

When creating App Firewall rules, you can create general rules based on incoming or outgoing traffic at the container level. For example, you can create a rule to deny any traffic from outside of a datacenter that targets a destination within the datacenter. You can create a rule to deny any incoming traffic that is not tagged with a VLAN ID.

All firewall rules configured by using REST requests appear under the App Firewall tab for the appropriate container in the vShield Manager user interface and vSphere Client plug-in.

For the complete firewall XML schema, see “vShield App Firewall Schema” on page 110.

Configuring the vShield App Firewall

Firewall precedence is hierarchical at each level. At the datacenter level, choices are DEFAULT, HIGH, or LOW. At the cluster and dvPortgroup level, firewall precedence is often set to NONE.

Each vShield App enforces the firewall rules in top-to-bottom ordering. A vShield App checks each traffic session against the top rule in the firewall table before moving down the subsequent rules in the table. The first rule in the table that matches the traffic parameters is enforced. See the vShield Administration Guide for more information about the hierarchy of vShield App firewall rules.

Query Firewall Configuration

You can retrieve the firewall configuration associated with a datacenter, cluster, or dvPortGroup. The template for the API is as follows:

GET https://<vsm-ip>/api/2.0/app/firewall/<context>/config?list=<L>&precedence=<P>&rulesType=<R>&configId=<C>

Where
<context> is the context ID of a datacenter, cluster, or dvPortGroup.

<L> is the listing type, one of the following:
- status for brief current state
- config for firewall configuration (the default)
- history for configuration history
- consolidated for combined configuration including all rules applicable in the context/

<P> is the rule precedence, either HIGH, LOW, DEFAULT, or NONE.

<R> can be LAYER3 or LAYER2 to filter the configuration rules for layer 3 or layer 2.

<C> is the configuration ID used in conjunction with the history listing type.

**Example 6-3. Queries for firewall configuration**

Get quick status:
GET https://<vsm-ip>/api/2.0/app/firewall/dvportgroup-63/config?list=status

Get complete firewall configuration for context datacenter-21:
GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-21/config

Get configuration of only high precedence rules:
GET https://<vsm-ip>/api/2.0/app/firewall/dvportgroup-63/config?list=config&precedence=HIGH

Get configuration of only low precedence rules:
GET https://<vsm-ip>/api/2.0/app/firewall/dvportgroup-63/config?list=config&precedence=LOW

Get configuration of only default precedence rules:
GET https://<vsm-ip>/api/2.0/app/firewall/dvportgroup-63/config?list=config&precedence=DEFAULT

Get configuration of only Layer 3 rules:
GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-21/config?list=config&rulesType=LAYER3

Get configuration of only high precedence layer 3 firewall rules:
GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-21/config?list=config&precedence=HIGH&rulesType=LAYER3

Get configuration of only low precedence layer 3 firewall rules:
GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-21/config?list=config&precedence=LOW&rulesType=LAYER3

Get configuration of only default precedence layer 3 firewall rules:
GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-21/config?list=config&precedence=DEFAULT&rulesType=LAYER3

Get configuration of only layer 2 firewall rules:
GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-21/config?list=config&rulesType=LAYER2

Get configuration of only high precedence layer 2 firewall rules:
GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-21/config?list=config&precedence=HIGH&rulesType=LAYER2

Get configuration of only low precedence layer 2 firewall rules:
GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-21/config?list=config&precedence=LOW&rulesType=LAYER2

Get configuration of only default precedence layer 2 firewall rules:
GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-21/config?list=config&precedence=DEFAULT&rulesType=LAYER2
Get consolidated configurations for the context:
GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-2/config?list=consolidated

Get a particular configuration history for a given context:
GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-2/config?list=history&configID=241

Configuration is returned as XML.

**Example 6-4. Get complete firewall configuration for a datacenter**

GET https://<vsm-ip>/api/2.0/app/firewall/datacenter-21/config?list=config

Response Body:

```xml
<VshieldAppConfiguration>
  <firewallConfiguration generationNumber="1312802020950" timestamp="1312802020950"

  <destination>
    <protocol>2054</protocol>
    <protocolName>ARP</protocolName>
  </destination>
</layer2FirewallRule>

<layer2FirewallRule disabled="false" precedence="default" id="1341"
Change Firewall Configuration

To configure vShield App firewall rules,

1. Query the firewall rules for the context you want to configure. The context can be a datacenter, cluster, or port-group.

2. Extract the XML from the response body in step 1 and make the desired changes to it.

3. Extract the value of the generation number from the Etag header of the response in Step 1, and add it as the if-match header in the POST call.

   For example, the generation number in the GET response for the firewall configuration of a datacenter is 1312802020950 (from Example 6-4). You must now specify the following header in the Request Body of a POST command for changing the datacenter firewall configuration:

   \[\text{If-Match}: "1312802020950"\]

4. Pass the modified XML from step 2 as the Request Body in a POST call.

   \[\text{IMPORTANT}\quad \text{You must specify the complete configuration for a context in the POST call.}\]

Revert to Default Firewall Configuration

You can revert the firewall configuration for the node to its default by deleting all rules that were created for the specified context ID, including default rules. For a datacenter or IP namespace, a fresh set of default rules are substituted.

Example 6-10. Delete firewall configuration and revert to default

Example:

\[\text{DELETE https://<vsm-ip>/api/2.0/app/firewall/<contextID>/config}\]

Configuring Fail-Safe Mode for vShield App Firewall

By default, failure or unavailability of the vShield App appliance results in traffic being blocked (fail close). You can change this to allow traffic (fail open).

Configure Fail-Safe Mode for vShield App Firewall

Example 6-11. Configure fail-safe mode

Example:

\[\text{PUT https://<vsm-ip>/api/2.1/app/failsafemode}\]

Request Body

\[<\text{VshieldAppConfiguration}>\]
\[<\text{failsafeConfiguration}>\]
\[<\text{failsafemode}>FAIL_OPEN</\text{failsafemode}>\]
\[</\text{failsafeConfiguration}>\]
\[</\text{VshieldAppConfiguration}>\]
Get Fail-Safe Mode Configuration for vShield App Firewall

Example 6-12. Get fail-safe mode configuration

Example:
GET https://<vsm-ip>/api/2.1/app/failsafemode

Working with SpoofGuard

It is possible for a guest operating system to spoof its IP address so that VMware Tools would misreport it to vCenter Server. The SpoofGuard feature allows the datacenter administrator to certify and authorize reported IP addresses, and if necessary, alter them. This is done by checking the IP address against the virtual machine’s MAC address, which comes from the VMX and cannot be spoofed.

The SpoofGuard feature is orthogonal to firewall rules. SpoofGuard blocks traffic if it thinks the IP is spoofed, whether or not firewall rules say to block.

Get SpoofGuard Global Settings

You can retrieve SpoofGuard settings such as the status (disabled or enabled), mode of operation, timestamp, and publishing authority.

Example 6-13. Get SpoofGuard settings

Example:
GET https://<vsm-ip>/api/2.0/spoofGuard/globalSettings

Edit SpoofGuard Global Settings

You can modify the SpoofGuard settings.

Example 6-14. Edit SpoofGuard settings

Example:
POST https://<vsm-ip>/api/2.0/spoofGuard/globalSettings

Request Body:
<VshieldConfiguration xmlns="vmware.vshield.global.20.spoofGuard">
  <globalSettings>
    <status>enabled</status>
    <mode>trustOnFirstUse</mode>
  </globalSettings>
</VshieldConfiguration>

Status can be enabled or disabled. Mode can be trustOnFirstUse or manual.

Get SpoofGuard IP Settings

You can retrieve a list of SpoofGuard settings, included IP addresses suspected of being forged, thus blocked.
Example 6-15. Get SpoofGuard settings

Example:

GET https://<vsm-ip>/api/2.0/spoofGuard/<contextID>?list=<querytype>

Where

- contextID can be the datacenterID or networkID of the portGroup which has been marked as namespace.
- querytype can be one of these: status, active, inActive, activeSinceLastPublished, requireReview, duplicates, or unPublished.

Save SpoofGuard IP Settings

You can save a list of SpoofGuard settings.

Example 6-16. Save SpoofGuard settings

Example:

POST https://<vsm-ip>/api/2.0/spoofGuard/<contextID>?action=<todo>

The <todo> action could be one of: approve, delete, publish, saveApproved.

An XML representation of VnicIdList is expected in the message body for delete and approve actions. If the action is publish then no message body is required. If the action is saveApproved then an XML representation of VnicInfo is expected.

Working with Namespaces

A vShield namespace is a set of vNICs that share a common IP address domain. They do not have overlapping IP addresses, so they are reachable all-at-once by simple routing or switching. There is no NAT between them. Any IP address in the namespace refers to the same vNIC regardless of where you look at it from within the IP address domain.

A datacenter (as managed by vCenter Server) stores a list of vShield namespaces. The namespace itself can specify a network name as an object ID, or it can contain a list of IP addresses.

Add Namespace in a Datacenter

You can define a new vShield namespace in the datacenter specified by <datacenter-id>.

Example 6-17. Add namespace in a datacenter

Request:

POST https://<vsm-ip>/api/2.0/namespace/datacenter/<datacenter-id>

Request Body:

<VshieldConfiguration xmlns="vmware.vshield.global.20.namespace">
  <namespace type="PORTGROUP" id="0">
    <namespacePortGroup>
      <id>network-184</id>
    </namespacePortGroup>
  </namespace>
</VshieldConfiguration>

In the request, <namespace-id> specifies the vShield namespace name.
In the example request body, the namespace is defined as being synonymous with object network-184.

**Get Namespace Details**

You can retrieve details about a previously added vShield namespace.

**Example 6-18. Get namespace details**

Request:

```
GET https://<vsm-ip>/api/2.0/namespace/datacenter/<datacenter-id>/<namespace-id>
```

**Delete a Namespace**

You can delete a previously added vShield namespace designated by <namespace-id>.

**Example 6-19. Delete namespace**

Request:

```
DELETE https://<vsm-ip>/api/2.0/namespace/datacenter/<datacenter-id>/<namespace-id>
```

**Show Namespaces in a Datacenter**

You can retrieve a list of all vShield namespaces in the datacenter specified by <datacenter-id>.

**Example 6-20. Get datacenter namespaces**

Example:

```
GET https://<vsm-ip>/api/2.0/namespace/datacenter/<datacenter-id>
```

**Show Port Groups that can be Marked as Namespace**

You can retrieve a list of all candidate port groups in the datacenter specified by <datacenter-id>. that can be marked as a separate namespace.

**Example 6-21. Get port groups that can be marked as namespace**

Example:

```
GET https://<vsm-ip>/api/2.0/namespace/datacenter/<datacenter-id>?list=candidate
```

**Show Configured Namespaces in Datacenter**

You can retrieve a list of all configured namespaces in the datacenter specified by <datacenter-id>.

**Example 6-22. Get configured namespaces in datacenter**

Example:

```
GET https://<vsm-ip>/api/2.0/namespace/datacenter/<datacenter-id>?list=configured
```

**Getting Flow Statistic Details**

You can retrieve a detailed view of the traffic on your virtual network that passed through a vShield App.
Get Flow Statistics

You can retrieve flow statistics for a datacenter, port group, virtual machine, or vNIC.

Example 6-23. Retrieve flow statistics

Example:

GET https://<vsm-ip>/api/2.1/app/flow/flowstats?contextId=datacenter-21&flowType=TCP_UDP
&startTime=0&endTime=1320917094000&startIndex=0&pageSize=2

<FlowStatsPage>
  <pagingInfo>
    <contextId>datacenter-2538</contextId>
    <flowType>TCP_UDP</flowType>
    <startTime>1327405883000</startTime>
    <endTime>1327482600000</endTime>

    <controlDirection>0</controlDirection>
  </flowStatsTcpUdp>
</FlowStatsPage>
Query parameters are described in the table below.

**Table 6-1. Query parameters for retrieving flow statistics call**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flowStats</td>
<td>Type of the flow to be retrieved. Possible values are TCP_UDP, LAYER2, and LAYER3.</td>
</tr>
<tr>
<td>contextId</td>
<td>vc-moref-id of the datacenter, port group, virtual machine, or UUID of the vNIC for which traffic flow is to be retrieved.</td>
</tr>
<tr>
<td>startTime</td>
<td>Flows with start time greater than the specified time are to be retrieved.</td>
</tr>
<tr>
<td>endTime</td>
<td>Flows with start time lower than the specified time are to be retrieved.</td>
</tr>
<tr>
<td>startIndex</td>
<td>Optional parameter that specifies the starting point for retrieving the flows. If this parameter is not specified, flows are retrieved from the beginning.</td>
</tr>
<tr>
<td>pageSize</td>
<td>Optional parameter that limits the maximum number of entries returned by the API. The default value for this parameter is 256 and the valid range is 1-1024.</td>
</tr>
</tbody>
</table>

**Table 6-2. Response values for retrieving flow statistics call**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startTime</td>
<td>Start time for current flow.</td>
</tr>
<tr>
<td>endTime</td>
<td>End time for current flow.</td>
</tr>
<tr>
<td>ruleId</td>
<td>rule Id for current flow.</td>
</tr>
<tr>
<td>blocked</td>
<td>Indicates whether traffic is blocked – 0:Flow allowed, 1:Flow blocked, 2:Flow blocked by Spoofguard.</td>
</tr>
<tr>
<td>protocol</td>
<td>protocol in flow – 0:TCP, 1:UDP, 2:ICMP.</td>
</tr>
<tr>
<td>direction</td>
<td>Direction of flow – 0:To virtual machine, 1:From virtual machine.</td>
</tr>
<tr>
<td>sessions</td>
<td>Number of sessions in current flow.</td>
</tr>
<tr>
<td>sourcePackets</td>
<td>Count of Packets from Source to Destination in current flow.</td>
</tr>
<tr>
<td>destinationPackets</td>
<td>Count of Packets from Destination to Source in current flow.</td>
</tr>
<tr>
<td>sourceBytes</td>
<td>Count of Bytes transferred from Source to Destination in current flow.</td>
</tr>
<tr>
<td>destinationBytes</td>
<td>Count of Bytes transferred from Destination to Source in current flow.</td>
</tr>
<tr>
<td>sourceIp</td>
<td>Source IP of current flow.</td>
</tr>
<tr>
<td>destinationIp</td>
<td>Destination IP of current flow.</td>
</tr>
<tr>
<td>sourceMac</td>
<td>Source Mac of current flow.</td>
</tr>
<tr>
<td>destinationMac</td>
<td>Destination Mac of current flow.</td>
</tr>
<tr>
<td>subtype</td>
<td>Identifies the sub type of current flow.</td>
</tr>
<tr>
<td>destinationPort</td>
<td>Port number of Destination for TCP/UDP traffic.</td>
</tr>
<tr>
<td>controlProtocol</td>
<td>Control protocol for dynamic TCP traffic.</td>
</tr>
<tr>
<td>controlSourceIp</td>
<td>Control source IP for dynamic TCP traffic.</td>
</tr>
<tr>
<td>controlDestinationIp</td>
<td>Control destination IP for dynamic TCP traffic.</td>
</tr>
<tr>
<td>controlDestinationPort</td>
<td>Control destination port for dynamic TCP traffic.</td>
</tr>
<tr>
<td>controlDirection</td>
<td>Control direction for dynamic TCP traffic – 0: Source-&gt;Destination, 1:Destination-&gt;Source.</td>
</tr>
</tbody>
</table>

**Get Flow Meta-Data**

You can retrieve the following information for each flow type:

- minimum stats time
- maximum end time
Example 6-24. Get flow meta-data for flow type

Example:

GET https://<vsm-ip>/api/2.1/app/flow/flowstats?contextId=datacenter-2538\&flowType=TCP_UDP\&startTime=1327405883000\&endTime=1327482600000\&startIndex=0\&pageSize=2

Response Body:

```xml
<FlowStatsPage>
  <pagingInfo>
    <contextId>datacenter-2538</contextId>
    <flowType>TCP_UDP</flowType>
    <startTime>1327405883000</startTime>
    <endTime>1327482600000</endTime>
    <totalCount>817</totalCount>
    <startIndex>0</startIndex>
    <pageSize>2</pageSize>
  </pagingInfo>
  <flowStatsTcpUdp>
    <startTime>1327405883000</startTime>
    <endTime>1327446000000</endTime>
    <ruleId>1001</ruleId>
    <blocked>0</blocked>
    <protocol>5</protocol>
    <direction>1</direction>
    <sessions>1449</sessions>
    <sourcePackets>1449</sourcePackets>
    <destinationPackets>0</destinationPackets>
    <sourceBytes>227493</sourceBytes>
    <destinationBytes>0</destinationBytes>
    <networkId>network-2553</networkId>
    <sourceIp>10.112.199.174</sourceIp>
    <destinationIp>255.255.255.255</destinationIp>
    <destinationPort>17500</destinationPort>
    <controlProtocol></controlProtocol>
  </flowStatsTcpUdp>
  <flowStatsTcpUdp>
    <startTime>1327405883000</startTime>
    <endTime>1327446000000</endTime>
    <ruleId>1001</ruleId>
    <blocked>0</blocked>
    <protocol>5</protocol>
    <direction>1</direction>
    <sessions>69</sessions>
    <sourcePackets>69</sourcePackets>
    <destinationPackets>0</destinationPackets>
    <sourceBytes>17832</sourceBytes>
    <destinationBytes>0</destinationBytes>
    <networkId>network-2553</networkId>
    <sourceIp>10.112.199.13</sourceIp>
    <destinationIp>10.112.199.255</destinationIp>
    <destinationPort>138</destinationPort>
    <controlProtocol></controlProtocol>
  </flowStatsTcpUdp>
</FlowStatsPage>
```
Excluding Virtual Machines from vShield App Protection

You can exclude a set of virtual machines from vShield App protection. This exclusion list is applied across all vShield App installations within the specified vShield Manager. If a virtual machine has multiple vNICs, all of them are excluded from protection.

Add a Virtual Machine to the Exclusion List

You can add a virtual machine to the exclusion list.

**Example 6-25. Add a virtual machine to exclusion list**

Example:

```plaintext
PUT https://<vsm-ip>/api/2.1/app/excludelist/<memberId>
```

Where `memberId` is the vc-moref-id of a virtual machine.

Get Virtual Machine Exclusion List

You can retrieve the set of virtual machines in the exclusion list.

**Example 6-26. Get exclusion list**

Example:

```plaintext
GET https://<vsm-ip>/api/2.1/app/excludelist/
```

Response Body:

```xml
<VshieldAppConfiguration>
  <excludeListConfiguration>
    <objectId>excludeList-1</objectId>
    <typeName>ExcludeList</typeName>
    <revision>1</revision>
    <objectTypeName>ExcludeList</objectTypeName>
    <excludeMember>
      <member>
        <objectId>vm-2371</objectId>
        <typeName>VirtualMachine</typeName>
        <name>VC-Win2k3</name>
        <revision>2</revision>
        <objectTypeName>VirtualMachine</objectTypeName>
        <scope>
          <id>domain-c731</id>
          <objectTypeName>ClusterComputeResource</objectTypeName>
          <name>Gaurav-CL</name>
        </scope>
      </member>
    </excludeMember>
  </excludeListConfiguration>
</VshieldAppConfiguration>
```

Delete a Virtual Machine from Exclusion List

You can delete a virtual machines from the exclusion list.
**Example 6-27.** Delete virtual machine from exclusion list

Example:
DELETE https://<vsm-ip>/api/2.1/app/excludelist/<memberID>

Where memberId is the vc-moref-id of a virtual machine.

**Configuring Syslog Service for a vShield App**

You can configure all vShield App instances to send system events to up to two syslog servers. All vShield App instances share the same syslog server configuration.

You can retrieve a list of syslog servers configured on the first vShield App instance that responds.

**Example 6-28.** Get the syslog server configuration for All vShield App instances

Request:
GET https://<vsm-ip>/api/1.0/zones/syslogServers

You can configure all vShield App instances connected to the vShield Manager to send events to the specified syslog servers.

**Example 6-29.** Post the syslog server configuration across all vShield App instances

Request:
POST https://<vsm-ip>/api/1.0/zones/syslogServers

You can delete the syslog server configuration across all vShield App instances connected to the vShield Manager.

**Example 6-30.** Delete the syslog server configuration across all vShield App instances

Request:
DELETE https://<vsm-ip>/api/1.0/zones/syslogServers

You can delete a syslog server across all vShield App instances connected to the vShield Manager.

**Example 6-31.** Delete a single syslog server by IP address from All vShield App instances

Request:
DELETE https://<vsm-ip>/api/1.0/zones/syslogServers/<ip_of_syslogServer>

**Synchronizing vShield App**

You can force vShield App to synchronize with the last good configuration in the vShield Manager database.

**Example 6-32.** Force Sync vShield App

Request:
POST https://<vsm-ip>/api/1.0/zones/host-28/forceSync
Querying vShield App Technical Support Log

You can generate and download the diagnostic log from a vShield App by host. You can then send the diagnostic log to technical support for assistance in troubleshooting an issue.

**Example 6-33. Generate Tech Support Log File for a vShield App**

Request:

```shell
GET https://<vsm-ip>/api/1.0/zones/<host-id>/techSupportLogs
```

```xml
<ZonesConfiguration>
    <TechSupportLogsTarFilePath>/tech_support_logs/vsz/vshield_zones_support_host-28_121311_06534
        6GMT.log.gz</TechSupportLogsTarFilePath>
</ZonesConfiguration>
```

**Example 6-34. Download Tech Support Log File for a vShield App**

Request:

```shell
https://<vsm-ip>/<TechSupportLogsFilePath>
```

The technical support log is placed in a file, however the REST API has no provision for downloading it, and `wget` and `curl` do not have permission to download it, either. You can retrieve the log with vShield Manager by clicking **Settings & Reports > Configuration > Support > [Log Download] Initiate.**

Upgrading vShield App

You can upgrade vShield App.

**Example 6-35. Define namespace in a datacenter**

Request:

```shell
POST https://<vsm-ip>/api/1.0/vshield/<host-id>/vsz
```

Request Body:

```xml
<VshieldConfiguration>
    <VszInstallParams>
        <DatastoreId>datastore-5131</DatastoreId>
        <ManagementPortSwitchId>network-5134</ManagementPortSwitchId>
        <MgmtInterface>
            <IpAddress>10.112.196.245</IpAddress>
            <NetworkMask>255.255.252.0</NetworkMask>
            <DefaultGw>10.112.199.253</DefaultGw>
        </MgmtInterface>
    </VszInstallParams>
    <InstallAction>upgrade</InstallAction>
</VshieldConfiguration>
```
A vShield Endpoint appliance delivers an introspection-based antivirus solution that uses the hypervisor to scan guest virtual machines from the outside with only a thin agent on each guest virtual machine.

This chapter includes the following topics:

- “Overview of Solution Registration” on page 81
- “Registering a Solution with vShield Endpoint Service” on page 81
- “Querying Registration Status of vShield Endpoint” on page 83
- “Querying Activated Security Virtual Machines for a Solution” on page 84
- “Unregistering a Solution with vShield Endpoint” on page 85
- “Status Codes and Error Schema” on page 86

**IMPORTANT** All vShield REST requests require authorization. See “Using the vShield REST API” on page 15 for details about basic authorization.

**Overview of Solution Registration**

To register a third-party solution with vShield Endpoint, clients can use four REST calls to do the following:

1. Register the vendor.
2. Register one or more solutions.
3. Set the solution IP address and port (for all hosts).
4. Activate registered solutions per host.

**NOTE** Steps 1 through 3 need to be performed once per solution, while step 4 needs to be performed for each host.

To unregister a solution, clients essentially perform these steps in reverse:

5. Deactivate solutions per host.
6. Unset a solution's IP address and port.
7. Unregister solutions.
8. Unregister the vendor.

To update registration information for a vendor or solution, clients must first unregister that entity and then reregister. The following sections detail the specific REST calls to perform registration and unregistration.

**Registering a Solution with vShield Endpoint Service**

The APIs described in this section register a vendor, solutions, set network address, and activate solutions.
For a list of return status codes, see “Return Status Codes” on page 86.

**Register a Vendor**

You can register the vendor of an antivirus solution.

**Example 7-1. Register a vendor**

Request:

POST https://<vsm-ip>/api/2.0/endpointsecurity/registration

Request Body:

```xml
<VendorInfo>
  <id>vendor_id</id>
  <title>vendor_title</title>
  <description>vendor_description</description>
</VendorInfo>
```

In the request body, `vendor_id` is the VMware-assigned ID for the vendor, while `vendor_title` and `vendor_description` are vendor provided strings.

**Register a Solution**

You can register an antivirus solution.

**Example 7-2. Register a solution**

Request:

POST https://<vsm-ip>/api/2.0/endpointsecurity/registration/<vendor_id>

Request Body:

```xml
<SolutionInfo>
  <altitude>solution_altitude</altitude>
  <title>solution_title</title>
  <description>solution_description</description>
</SolutionInfo>
```

In the request, `<vendor_id>` is the previously registered ID for the vendor.

In the request body, `solution_altitude` is the VMware-assigned altitude for the solution, `solution_title` and `solution_description` are vendor provided strings. See “Altitude of a Solution” on page 82.

**Altitude of a Solution**

Altitude is a number that VMware assigns to uniquely identify the solution. The altitude describes the type of solution and the order in which the solution receives events relative to other solutions on the same host.

**IP Address and Port for a Solution**

You can set a solution's IP address and port on the vNIC host.

**Example 7-3. Set IP address and port**

Request:

POST https://<vsm-ip>/api/2.0/endpointsecurity/registration/<vendor_id>/<altitude>/location

Request Body:

```xml
<LocationInfo>
  <ip>solution_ip_address</ip>
</LocationInfo>
```
In the request, `<vendor_id>` is the previously registered ID for the vendor, and `<altitude>` for the altitude.

In the request body, `solution_ip_address` is the solution's IPv4 address for the vNIC that is connected to the VMkernel port group (for example, 169.254.1.31). This address must be within the range of VMware-assigned IP addresses for the solution. The `solution_port` is the port on which the solution accepts connections.

If you want to change the location of a solution, deactivate all security virtual machines, change the location, and then reactivate all security virtual machines.

### Activate a Solution

You can activate a solution that has been registered and located.

**Example 7-4. Activate solution**

Request:

```plaintext
POST https://<vsm-ip>/api/2.0/endpointsecurity/activation/<vendor_id>/<altitude>
```

Request Body:

```xml
<ActivationInfo>
  <moid>solution_moid</moid>
</ActivationInfo>
```

In the request, `<vendor_id>` is the previously registered ID for the vendor, and `<altitude>` for the altitude.

In the request body, `solution_moid` is the managed object ID of the activated solution's virtual machine.

### Querying Registration Status of vShield Endpoint

You can use the same URLs shown in the previous section with the GET method to retrieve vendor registration information, solution registration information, location information, and solution activation status.

### Get Vendor Registration

You can retrieve vendor registration information.

**Example 7-5. Get list of all registered vendors**

Request:

```plaintext
GET https://<vsm-ip>/api/2.0/endpointsecurity/registration/vendors
```

**Example 7-6. Get vendor registration information**

Request:

```plaintext
GET https://<vsm-ip>/api/2.0/endpointsecurity/registration/<vendor_id>
```

### Get Solution Registration

You can retrieve solution registration information.

**Example 7-7. Get all registered solutions for a vendor**

Request:
GET https://<vsm-ip>/api/2.0/endpointsecurity/registration/<vendor_id>/solutions

Example 7-8. Get solution registration information

Request:
GET https://<vsm-ip>/api/2.0/endpointsecurity/registration/<vendor_id>/<altitude>

Get IP Address of a Solution

This call retrieves the IP address and port associated with a solution.

Example 7-9. Get IP address and port of a solution

Request:
GET https://<vsm-ip>/api/2.0/endpointsecurity/registration/<vendor_id>/<altitude>/location

Get Activation Status of a Solution

This call retrieves solution activation status, given the managed object reference <moid> of its virtual machine.

Example 7-10. Get activation status of a solution

Request:
GET https://<vsm-ip>/api/2.0/endpointsecurity/activation/<vendor_id>/<altitude>/<moid>

Status can be false (not activated) or true (activated).

Querying Activated Security Virtual Machines for a Solution

You can retrieve a list of activated security virtual machines for a solution, as well as the activation information for all activated security virtual machines on a host.

Query Activated Security Virtual Machines

You can retrieve a list of activated security virtual machines for the specified solution.

Example 7-11. Get activated security virtual machines

Request:
GET https://<vsm-ip>/api/2.0/endpointsecurity/activation/<vendor_id>/<solution_id>

Response Body:
<ActivatedSVMs>
  <ActivationInfo>
    <moid>vm-819</moid>
    <hostMoid>host-9</hostMoid>
    <vmName>VMWARE-Data Security-10.24.130.174</vmName>
    <hostName>10.24.130.174</hostName>
    <clusterName>Dev</clusterName>
    <dcName>dev</dcName>
    <vendorId>VMWARE</vendorId>
    <solutionId>6341068275337723904</solutionId>
  </ActivationInfo>
  ...

In the request, vendor_id is the VMware-assigned ID for the vendor, while solution_id is the solution ID.

**Query Activation Information**

You can retrieve activation information for all activated security virtual machines on the specified host.

**Example 7-12. Get activation information**

Request:

GET https://<vsm-ip>/api/2.0/endpointsecurity/activation?hostId=<hostID>

Response Body:

```xml
<ActivatedSVMs>
  <ActivationInfo>
    <moid>vm-819</moid>
    <hostMoid>host-9</hostMoid>
    <vmName>VMWARE-Data Security-18.24.130.174</vmName>
    <hostName>10.24.130.174</hostName>
    <clusterName>Dev</clusterName>
    <dcName>dev</dcName>
    <vendorId>VMWARE</vendorId>
    <solutionId>6341068275337723904</solutionId>
  </ActivationInfo>
  ...
</ActivatedSVMs>
```

**Unregistering a Solution with vShield Endpoint**

You can use the same URIs shown in the first section with the DELETE method to unregister a vendor, unregister a solution, unset location information, or deactivate a solution.

**Unregister a Vendor**

This call unregisters a vendor.

**Example 7-13. Unregister a vendor**

Request:

DELETE https://<vsm-ip>/api/2.0/endpointsecurity/registration/<vendor_id>

**Unregister a Solution**

This call unregisters a solution.

**Example 7-14. Unregister a vendor**

Request:

DELETE https://<vsm-ip>/api/2.0/endpointsecurity/registration/<vendor_id>/<altitude>

**Unset IP Address**

This call unsets a solution’s IP address and port.
Example 7-15. Unset IP address and port

Request:
DELETE https://<vsm-ip>/api/2.0/endpointsecurity/registration/<vendor_id>/<altitude>/location

Deactivate a Solution

This call deactivates a solution on a host.

Example 7-16. Deactivate a solution

Request:
DELETE https://<vsm-ip>/api/2.0/endpointsecurity/activation/<vendor_id>/<altitude>/<moid>

Status Codes and Error Schema

This section lists various status codes returned from the REST API, and shows the error schema.

Return Status Codes

The 200 codes indicate success, the 400 codes indicate some failure, and the 600 codes are call specific.

- 200 OK operation successful
- 201 Created: Entity successfully altered.
- 400 Bad Request: Internal error codes. Please refer to the Error Schema for more details.
- 401 Unauthorized: Incorrect user name or password.
- 600 Unrecognized vendor ID.
- 601 Vendor is already registered.
- 602 Unrecognized altitude.
- 603 Solution is already registered.
- 604 Invalid IPv4 address.
- 605 Invalid port.
- 606 Port out of range.
- 607 Unrecognized moid.
- 608 Location information is already set.
- 609 Location not set.
- 612 Solutions still registered.
- 613 Solution location information still set.
- 614 Solution still activated.
- 615 Solution not activated.
- 616 Solution is already activated.
- 617 IP:Port already in use.
- 618 Bad solution ID.
- 619 vShield Endpoint is not licensed.
- 620 Internal error.

Error Schema

Here is the XML schema for vShield Endpoint registration errors.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
  elementFormDefault="qualified"/>
```
<xs:element name="Error">
  <xs:complexType>
    <xs:sequence>
      <xs:element name="code" type="xs:unsignedInt"/>
      <xs:element name="description" type="xs:string"/>
    </xs:sequence>
  </xs:complexType>
</xs:element>
vShield Data Security provides visibility into sensitive data stored within your organization's virtualized and cloud environments. Based on the violations reported by vShield Data Security, you can ensure that sensitive data is adequately protected and assess compliance with regulations around the world.

This chapter includes the following topics:

- “vShield Data Security User Roles” on page 89
- “Defining a Data Security Policy” on page 90
- “Saving and Publishing Policies” on page 95
- “Data Security Scanning” on page 96
- “Querying Scan Results” on page 97
- “Querying Violation Details” on page 101

To begin using vShield Data Security, you create a policy that defines the regulations that apply to data security in your organization and specifies the areas of your environment and files to be scanned. When you start a Data Security scan, vShield analyzes the data on the virtual machines in your vSphere inventory and reports the number of violations detected and the files that violated your policy.

After you analyze the results of the scan, you can edit your policy as required. When you edit a policy, you must enable it by publishing the changes.

Note that you cannot install vShield Data Security using a REST API. For information on installing vShield Data Security, see the vShield Quick Start Guide.

To deploy vShield Data Security, you must install the latest version of VMware Tools on each virtual machine that you want to scan. This installs a Thin Agent, which allows the SVM to scan the virtual machines.

### vShield Data Security User Roles

A user’s role determines the actions that the user can perform. A user can only have one role. You cannot add a role to a user, or remove an assigned role from a user, but you can change the assigned role for a user.

<table>
<thead>
<tr>
<th>Role</th>
<th>Actions Allowed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise administrator</td>
<td>All vShield operations and security.</td>
</tr>
<tr>
<td>vShield administrator</td>
<td>vShield operations only: for example, install virtual appliances, and configure port groups.</td>
</tr>
<tr>
<td>Security administrator</td>
<td>Create and publish policies, view violation reports. Cannot start or stop data security scans.</td>
</tr>
<tr>
<td>Auditor</td>
<td>View configured policies and violation reports. Read-only.</td>
</tr>
</tbody>
</table>
Defining a Data Security Policy

In order to detect sensitive data in your environment, you must create a data security policy. You must be a Security Administrator to create policies.

To define a policy, you must specify the following:

- **Regulations**
  A regulation is a data privacy law for protecting PCI (Payment Card Industry), PHI (Protected Health Information) and PII (Personally Identifiable Information) information. You can select the regulations that your company needs to comply to. When you run a scan, vShield Data Security identifies data that violates the regulations in your policy, and is hence sensitive for your organization.

- **Participating areas**
  By default, your entire vCenter inventory is scanned. To scan a subset of your inventory, you can specify the security groups that you want to include or exclude.

- **File filters**
  You can create filters to limit the data being scanned and exclude the file types unlikely to contain sensitive data from the scan.

In the data security APIs, dlp in the pathname stands for data loss prevention (DLP).

Query Regulations

You can retrieve the list of available regulations for a policy. The output includes regulation IDs and the embedded classifications for each regulation.

**Example 8-1. Get all SDD policy regulations**

Request:

GET https://<vsm-ip>/api/2.0/dlp/regulation

Response:

```
<set>
  <Regulation>
    <id>66</id> Regulation ID
    <name>California AB-1298</name>
    <description>Identifies documents and transmissions that contain protected health information (ePHI) and personally identifiable information (PII) as regulated by California AB-1298 (Civil Code 56, 1785 and 1798)...</n
    <classifications>
      <Classification>
        <id>10</id> Classification ID
        <name>Credit Card Track Data</name>
        <providerName>Credit Card Track Data</providerName>
        <description>Credit Card Track Data</description>
        <customizable>false</customizable>
      </Classification>
      ...
    </classifications>
  </Regulation>
  ...
</set>
```

Enable a Regulation

You can enable one or more regulations by putting the regulation IDs into the policy. You can get the appropriate regulation IDs from the output of the retrieve regulations API (see Example 8-1). In the example request body, regulation 66 is California AB-1298, and regulations 67 and 68 originate elsewhere.
**Example 8-2. Enable a regulation**

Request:

PUT https://<vsm-ip>/api/2.0/dlp/policy/regulations

Request Body:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<set>
  <long>66</long>
  <long>67</long>
  <long>68</long>
</set>
```

**Query Classification Value**

You can retrieve the classification values associated with regulations that monitor Group Insurance Numbers, Health Plan Beneficiary Numbers, Medical Record Numbers, or Patient Identification Numbers. The output includes the classification ID.

**Example 8-3. Get all classification values associated with customizable classifications**

Request:

GET https://<vsm-ip>/api/2.0/dlp/classificationvalue

**Configure a Customized Regex as a Classification Value**

You can configure a ClassificationValue with a customized regex that must be matched during violation inspection. You must include the appropriate classification ID, which you can get from the output of the retrieve classification value API.

**Example 8-4. Configure a customized regex as a classification value**

Request:

PUT https://<vsm-ip>/api/2.0/dlp/policy/classificationvalues

Authorization: Basic YWRtaW46ZGVmYXVsdA==

```xml
<set>
  <ClassificationValue>
    <id>3</id>
    <classification>
      <id>15</id>
      <name>Health Plan Beneficiary Numbers</name>
      <providerName>Health Plan Beneficiary Numbers</providerName>
      <description>Health Plan Beneficiary Numbers</description>
      <customizable>true</customizable>
    </classification>
    <value>PATNUM-[0-9]{10}</value>
  </ClassificationValue>
</set>
```

**View the List of Excludable Areas**

You can retrieve the list of datacenters, clusters, and resource pools in your inventory to help you determine the areas you might want to exclude from policy inspection.
Example 8-5. View the list of excludable areas

Request:
GET https://<vsm-ip>/api/2.0/dlp/excludableareas

Response:
<set>
  <EnhancedInfo>
    <objectId>datacenter-2</objectId>
    <name>jdoe</name>
    <revision>32</revision>
    <objectTypeName>Datacenter</objectTypeName>
    <ownerName>VMware</ownerName>
  </EnhancedInfo>
  <EnhancedInfo>
    <objectId>datacenter-94</objectId>
    <name>jdoe</name>
    <revision>32</revision>
    <objectTypeName>Datacenter</objectTypeName>
    <ownerName>VMware</ownerName>
  </EnhancedInfo>
  <EnhancedInfo>
    <objectId>resgroup-3725</objectId>
    <name>ResourcePool1</name>
    <revision>2</revision>
    <objectTypeName>ResourcePool</objectTypeName>
    <ownerName>jdoe</ownerName>
  </EnhancedInfo>
  <EnhancedInfo>
    <objectId>domain-c2720</objectId>
    <name>Cluster1</name>
    <revision>17</revision>
    <objectTypeName>ClusterComputeResource</objectTypeName>
    <ownerName>jdoe</ownerName>
  </EnhancedInfo>
  <EnhancedInfo>
    <objectId>resgroup-3726</objectId>
    <name>ResourcePool2</name>
    <revision>1</revision>
    <objectTypeName>ResourcePool</objectTypeName>
    <ownerName>jdoe</ownerName>
  </EnhancedInfo>
</set>

Exclude Areas from Policy Inspection

This API is deprecated as of vShield 5.0.1. Instead, use the API for excluding security groups from a scan. For more information, see Example 8-8, “Exclude a security group from the scan,” on page 93.

You can exclude one or more datacenters, resource pools or clusters from policy inspection by including the object ID of each area to exclude. You can get the object ID from the output of the View the list of excludable areas API (see Example 8-5).

Example 8-6. Exclude areas from policy inspection

Request:
PUT https://<vsm-ip>/api/2.0/dlp/policy/excludedareas

Authorization: Basic YWRtaW46ZGVmYXVsdA==

<set>
  <string>datacenter-3720</string>
</set>
Specify Security Groups to be Scanned

To scan a subset of your inventory, you can specify the security groups that you want to include or exclude in the data security scan.

**Example 8-7. Include a security group in the scan**

Request:
PUT https://<vsm-ip>/api/2.0/dlp/policy/includedsecuritygroups/

Request Body:

```xml
<set>
  <string>securitygroup-id-1</string>
  <string>securitygroup-id-1</string>
</set>
```

**Example 8-8. Exclude a security group from the scan**

Request:
PUT https://<vsm-ip>/api/2.0/dlp/policy/excludedsecuritygroups/

Request Body:

```xml
<set>
  <string>securitygroup-id-1</string>
  <string>securitygroup-id-1</string>
</set>
```

Query Security Groups Being Scanned

You can retrieve the security groups that have been included or excluded from data security scans.

**Example 8-9. Get included security groups**

Request:
GET https://<vsm-ip>/api/2.0/dlp/policy/includedsecuritygroups

Response:

```xml
<set>
  <basicinfo>
    <objectId>securitygroup-1</objectId>
    <type>
      <typeName>SecurityGroup</typeName>
    </type>
    <name>included</name>
    <revision>2</revision>
    <objectTypeName>SecurityGroup</objectTypeName>
    <scope>
      <id>datacenter-2</id>
      <objectTypeName>Datacenter</objectTypeName>
      <name>jkiriyakoz</name>
    </scope>
  </basicinfo>
</set>
```
**Example 8-10. Get excluded security groups**

Request:
GET https://<vsm-ip>/api/2.0/dlp/policy/excludedsecuritygroups/

Response:
```
<set>
  <basicinfo>
    <objectId>securitygroup-1</objectId>
    <type>
      <typeName>SecurityGroup</typeName>
    </type>
    <name>included</name>
    <revision>2</revision>
    <objectTypeName>SecurityGroup</objectTypeName>
    <scope>
      <id>datacenter-2</id>
      <objectTypeName>Datacenter</objectTypeName>
      <name>jkiryokozo</name>
    </scope>
  </basicinfo>
</set>
```

---

**Configure File Filters**

You can restrict the files you want to scan based on size, last modified date, or file extensions.

The following file filters are available:

- **sizeLessThanBytes** – scan only files with a byte size less than the specified number.
- **lastModifiedBefore** – scan only files modified before the specified date. The date must be specified in GMT format (YYYY-MM-DD HH:MM:SS).
- **lastModifiedAfter** – scan only files modified after the specified date. The date must be specified in GMT format (YYYY-MM-DD HH:MM:SS).
- **extensionsIncluded** – Boolean value as in Table 8-1.

**Table 8-2. Included extensions parameter**

<table>
<thead>
<tr>
<th>Value of the extensionsIncluded parameter</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>true followed by the extensions parameter containing one or more extensions</td>
<td>Only files with the specified extensions are scanned</td>
</tr>
<tr>
<td>false followed by the extensions parameter containing one or more extensions</td>
<td>All files are scanned except those with the specified extensions.</td>
</tr>
</tbody>
</table>

The **scanAllFiles** parameter determines if all files should be inspected during a scan operation. This parameter overrides all other parameters, so set this parameter to false if you are configuring a filter.

**Example 8-11. Scan only PDF and XLXS files modified after 10/19/2011**

Request:
PUT https://<vsm-ip>/api/2.0/dlp/policy/FileFilters
```
<FileFilters>
  <scanAllFiles>false</scanAllFiles>
  <lastModifiedAfter>2011-10-19 15:16:04.0 EST</lastModifiedAfter>
  <extensionsIncluded>true</extensionsIncluded>
  <extensions>pdf,xlsx</extensions>
</FileFilters>
```
Example 8-12. Scan all files except PDF and XLXS files

Request:
PUT https://<vsm-ip>/api/2.0/dlp/policy/FileFilters
<FileFilters>
    <scanAllFiles>false</scanAllFiles>
    <extensionsIncluded>false</extensionsIncluded>
    <extensions>pdf,xlsx</extensions>
</FileFilters>

Example 8-13. Scan PDF and XLXS files that are less than 100 MB in size

Request:
PUT https://<vsm-ip>/api/2.0/dlp/policy/FileFilters
<FileFilters>
    <scanAllFiles>false</scanAllFiles>
    <sizeLessThanBytes>100000000</sizeLessThanBytes>
    <extensionsIncluded>true</extensionsIncluded>
    <extensions>pdf,xlsx</extensions>
</FileFilters>

Saving and Publishing Policies

After you have defined a data security policy, you can edit it by changing the regulations selected, areas excluded from the scan, or the file filters. To apply the edited policy, you must publish it.

Query Saved Policy

As a best practice, you should retrieve and review the last saved policy before publishing it. Each policy contains a revision value that can be used to track version history.

Example 8-14. Get saved SDD policy

Request:
GET https://<vsm-ip>/api/2.0/dlp/policy/saved
Authorization: Basic YWRtaW46ZGVmYXVsdA==

Response: the following response contains a policy with a single regulation, Indiana HB-1101.

<DlpPolicy>
    <objectId>DlpPolicy-1</objectId>
    <type>
        <typeName>DlpPolicy</typeName>
    </type>
    <name>DlpPolicy-One</name>
    <revision>6</revision>
    <objectTypeName>DlpPolicy</objectTypeName>
    <regulations>
        <Regulation>
            <id>37</id>
            <name>Indiana HB-1101</name>
            <description>Indiana HB-1101</description>
            <classifications>
                <Classification>
                    <id>16</id>
                    <name>US National Provider Identifier</name>
                    <providerName>US National Provider Identifier</providerName>
                    <description>US National Provider Identifier</description>
                    <customizable>false</customizable>
                </Classification>
            </classifications>
        </Regulation>
    </regulations>
</DlpPolicy>
Query Published Policy

You can retrieve the currently published SDD policy that is active on all vShield Endpoint SVMs.

**Example 8-15. Get published SDD policy**

Request:

GET https://<vsm-ip>/api/2.0/dlp/policy/published
Authorization: Basic YWRtaW46ZGVmYXVsdA==

Publish the Updated Policy

After updating a policy with added regulations, excluded areas, or customized regex values publish the policy to enforce the new parameters.

**Example 8-16. Publish the updated policy**

Request:

PUT https://<vsm-ip>/api/2.0/dlp/policy/publish

Data Security Scanning

Running a data security scan identifies data in your virtual environment that violates your policy.
All virtual machines in your datacenter are scanned once during a scan. If the policy is edited and published while a scan is running, the scan restarts. This rescan ensures that all virtual machines comply with the edited policy. A rescan is triggered by publishing an edited policy, not by data updates on your virtual machines. After you start a scan, it continues to run until you pause or stop it.

If new virtual machines are added to your inventory while a scan is in progress, those machines will also be scanned. If a virtual machine is moved to an excluded cluster or resource pool while the data security scan is in progress, the files on that virtual machine are not scanned. In case a virtual machine is moved via vMotion to another host, the scan continues on the second host (files that were scanned while the virtual machine was on the previous host are not scanned again).

vShield Data Security scans one virtual machine on a host at a time to minimize impact on performance. VMware recommends that you pause the scan during normal business hours to avoid any performance overhead.

**Start, Pause, Resume, or Stop a Scan Operation**

You can start or stop a scan operation. The scan operation options are as follows:

- **START**: Start a new scan.
- **PAUSE**: Pause a started scan.
- **RESUME**: Resume a paused scan.
- **STOP**: Stop any scan.

**Example 8-17. Start, pause, resume, or stop a scan operation**

Request:

```
PUT https://<vsm-ip>/api/2.0/dlp/scanop
<ScanOp>STOP</ScanOp>
```

**Query Status for a Scan Operation**

You can retrieve the status of the scan operation to determine if a scan is **STARTED** (that is, in progress), **PAUSED**, or **STOPPED**. The **nextScanOps** parameter indicates the scan operations possible from your current state. In the following example, the current scan state is Stopped and the only action you can perform is Start the scan.

**Example 8-18. Get scan status**

Request:

```
GET https://<vsm-ip>/api/2.0/dlp/scanstatus
```

Response:

```
<DlpScanStatus>
 <currentScanState>STOPPED</currentScanState>
 <nextScanOps><ScanOp>START</ScanOp></nextScanOps>
 <vmsInProgress>0</vmsInProgress>
 <vmsCompleted>0</vmsCompleted>
</DlpScanStatus>
```

**Querying Scan Results**

You can retrieve detailed results of the current data security scan as well as summary results for the previous five scans.
Get List of Virtual Machines Being Scanned

You can retrieve information about the virtual machines being scanned by a scan.

**Example 8-19. Get list of virtual machines being scanned**

Request:

GET https://<vsm-ip>/api/2.0/dlp/scan/current/vms/<id>?
scanstatus=COMPLETED&page-size=10&start-index=1

Response:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<VmScanStatusDp>
  <dataPage>
    <pagingInfo>
      <pageSize>10</pageSize>
      <startIndex>1</startIndex>
      <totalCount>2</totalCount>
      <sortOrderAscending>false</sortOrderAscending>
    </pagingInfo>
    <VmScanStatus>
      <startTime>1320803585000</startTime>
      <endTime>1320803826000</endTime>
      <vmMoId>vm-25</vmMoId>
      <scanStatus>COMPLETED</scanStatus>
      <violationCount>8</violationCount>
      <vmName>jim-win2k8-32-mux</vmName>
      <dcName>jack</dcName>
    </VmScanStatus>
  </dataPage>
</VmScanStatusDp>
```

Where

- **id** is an optional parameter which limits the filter results by the VC MOID of a datacenter, cluster, or resource pool.
- **scanstatus** specifies the scan status of the virtual machines to be retrieved. Possible values are all, notstarted, started, and completed. This limits the results to virtual machines that have the specified scan state.
- **pagesize** limits the maximum number of entries returned by the API. The default value for this parameter is 256 and the valid range is 1-1024.
- **startindex** specifies the starting point for retrieving the logs. If this parameter is not specified, logs are retrieved from the beginning.

Get Number of Virtual Machines Being Scanned

You can retrieve the number of virtual machines being scanned.

**Example 8-20. Get number of virtual machines being scanned**

Request:

GET https://<vsm-ip>/api/2.0/dlp/scan/current/vms/count/<id>?
scanstatus=COMPLETED

Where

- **scanstatus** is an optional parameter that specifies the scan status of the virtual machines to be retrieved. Possible values are all, notstarted, started, and completed. This limits the results to virtual machines that have the specified scan state.
Get Summary Information about the Last Five Scans

You can retrieve the start and end time, total number of virtual machines scanned, and total number of violations for the last five completed data security scans.

**Example 8-21. Get summary information about last five scans**

**Request:**
GET https://<vsm-ip>/api/2.0/dlp/completedscansummaries

**Response:**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<list>
  <CompletedScanSummary>
    <globalScanId>5</globalScanId>
    <startTime class="sql-timestamp">2011-11-09 17:02:48.0</startTime>
    <endTime class="sql-timestamp">2011-11-09 17:02:55.0</endTime>
    <totalVmsScannedCount>0</totalVmsScannedCount>
    <totalViolationCount>0</totalViolationCount>
  </CompletedScanSummary>
</list>
```

Get Information for Virtual Machines Scanned During Previous Scan

You can retrieve the following information about the virtual machines scanned during the previous data security scan:

- ID
- Name
- Scan status
- Violation count

**Example 8-22. Get Information for virtual machines scanned during last scan**

**Request:**
GET https://<vsm-ip>/api/2.0/dlp/scan/<scan_ID>/detailsascsv

Retrieve Information About Previous Scan Results

You can retrieve a detailed report about the results of the previous scan in a CSV format.

**Example 8-23. Retrieves Information for virtual machines scanned during last scan**

**Request:**
GET https://<vsm-ip>/api/2.0/dlp/scan/<scan_ID>/violatingfilesascsv

Get XML Representation of Policy Used for Previous Scan

You can retrieve the XML representation of the policy used in the previous scan.
Example 8-24. Get XML representation of policy used in previous scan

Request:
GET https://<vsm-ip>/api/2.0/dlp/scan/<scan_ID>/policyasxml

Response:

<DlpPolicy>
  <objectId>dlppolicy-2</objectId>
  <type><typeName>DlpPolicy</typeName></type>

      </classification>
    </ClassificationValue>
  </classificationValues>
</DlpPolicy>
Querying Violation Details

Once you start a data security scan, vShield reports the regulations that are being violated by the files in your inventory, and the violating files. If you fix a violating file (by deleting the sensitive information from the file, deleting or encrypting the file, or editing the policy), the file will continue to be displayed in the Violating files section until the current scan completes, and a new scan starts and completes.

You must be a Security Administrator or Auditor to view reports.

Get List of Violation Counts

You can view a report that displays the violated regulations with the number of violations for each regulation. The violating files report requires filtering by node ID.

Example 8-25. Get violation count for entire inventory

Request:

GET https://vsm-ip/api/2.0/dlp/violations/

Example 8-26. Get violation count for specific resource

Request:

GET https://vsm-ip/api/2.0/dlp/violations/<context_ID>

Response Body

```xml
<list>
  <Violations>
    <scope>
      <objectId>group-d1</objectId>
      <type>
        <typeName>Folder</typeName>
      </type>
      <name>Datacenters</name>
      <revision>1</revision>
      <objectTypeName>Folder</objectTypeName>
    </scope>
    <regulation>
      <id>100</id>
      <name>California AB-1298</name>
      <description>Identifies documents and transmissions that contain protected health information (ePHI) and personally identifiable information (PII) as regulated by California AB-1298 (Civil Code 56, 1785 and 1798). California residents medical and health insurance information, when combined with personally identifiable information must be protected from unauthorized access, destruction, use, modification, or disclosure. Any business that operates in California and owns or licenses computerized ePHI and PII data for California residents, regardless of the physical location of the business, is required to comply with this law. This policy detects US Social Security Numbers,
```
credit card numbers, California drivers license numbers, US National Provider Numbers, group insurance numbers, health plan beneficiary numbers, medical record numbers, patient identifiers, birth and death certificates and Healthcare Dictionaries.

    <categories>
        <string>PHI</string>
        <string>PCI</string>
        <string>PII</string>
    </categories>
</regulation>
    <violationCount>1</violationCount>
</Violations>
</list>

Where context_ID is the MOID of a datacenter, cluster, folder, resource pool, or virtual machine.

Get List of Violating Files

You can view a report that displays the violating files and the regulations each file violated. This API requires filtering by context node ID, and returns a formatted XML report showing violating files.

Example 8-27. Get violating files for entire inventory

Request:
GET https://<vsm-ip>/api/2.0/dlp/violatingfiles?pagesize=<i>&startindex=<j>

Where:
- pagesize is the number of results to view.
- startindex is the page number from which the results should be displayed.

Example 8-28. Get violating files for a resource

Request:
GET https://<vsm-ip>/api/2.0/dlp/violatingfiles/<context_ID>?pagesize=<i>&startindex=<j>

Response Body:
<ViolatingFiles>
    <dataPage>
        <pagingInfo>
            <pageSize>10</pageSize>
            <startIndex>0</startIndex>
            <totalCount>1</totalCount>
            <sortOrderAscending>false</sortOrderAscending>
        </pagingInfo>
        <ViolatingFile>
            <identifier>59</identifier>
            <revision>0</revision>
        </ViolatingFile>
    </dataPage>
</ViolatingFiles>

</violations>
</ViolatingFile>
</dataPage>
</ViolatingFiles>

Where:
- **context_ID** is the MOID of a datacenter, cluster, folder, resource pool, or virtual machine.
- **pagesize** is the number of results to view.
- **startIndex** is the page number from which the results should be displayed.

**Get List of Violating Files in CSV Format**

You can view a report that displays the violating files and the regulations each file violated in a CSV format.

**Example 8-29. Get list of violating files in CSV format**

Request:
GET https://<vsm-ip>/api/2.0/dlp/violatingfilesascsv

Get Violations in Entire Inventory

You can view a report of the violated regulations and the violating files for the entire inventory in CSV (comma separated variable) format.

**Example 8-30. Get list of violated regulations**

Request:

GET https://<vsm-ip>/api/2.0/dlp/violatingfilesascsv/<context_ID>

Where context_ID is the MOID of a datacenter, cluster, folder, resource pool, or virtual machine.
Appendix

The REST API configuration of the vShield Edge and vShield App virtual machines supports schemas for installation and service management.

This appendix covers the following topics:

- “vShield Manager Global Configuration Schema” on page 105
- “ESX Host Preparation and Uninstallation Schema” on page 108
- “vShield App Schemas” on page 109
- “vShield Edge Schemas” on page 116
- “Error Message Schema” on page 128

vShield Manager Global Configuration Schema

The following schema shows vShield Manager REST configuration.

This replaces the 1.0 API schema items for vCenter synchronization, DNS service, virtual machine information, and security groups.

```xml
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    targetNamespace="vmware.vshield.edge.2.0"

Error Message Schema

This schema details error messages.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema" elementFormDefault="qualified">

  <xs:element name="Errors">
    <xs:complexType>
      <xs:sequence>
        <xs:element maxOccurs="unbounded" name="Error" type="ErrorType"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>

  <xs:complexType name="ErrorType">
    <xs:sequence>
      <xs:element name="code" type="xs:unsignedInt"/>
      <xs:element name="description" type="xs:string"/>
      <xs:element minOccurs="0" name="detailedDescription" type="xs:string"/>
      <xs:element minOccurs="0" name="index" type="xs:int"/>
      <xs:element minOccurs="0" name="resource" type="xs:NMTOKEN"/>
      <xs:element minOccurs="0" name="requestId" type="xs:NMTOKEN"/>
      <xs:element minOccurs="0" name="module" type="xs:NMTOKEN"/>
    </xs:sequence>
  </xs:complexType>

</xs:schema>
```

If a REST API call results in an error, the HTTP reply contains the following information:

- An XML error document as the response body
- Content-Type: application/xml
- An appropriate 2xx, 4xx, or 5xx HTTP status code
### Table 9-1. Error Message Status Codes

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 OK</td>
<td>The request was valid and has been completed. Generally, this response is accompanied by a body document (XML).</td>
</tr>
<tr>
<td>201 Created</td>
<td>The request was completed and new resource was created. The Location header of the response contains the URI of newly created resource.</td>
</tr>
<tr>
<td>204 No Content</td>
<td>Same as 200 OK, but the response body is empty (No XML).</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request body contains an invalid representation or the representation of the entity is missing information. The response is accompanied by Error Object (XML).</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>An authorization header was expected. Request with invalid or no vShield Manager Token.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The user does not have enough privileges to access the resource.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The resource was not found. The response is accompanied by Error Object (XML).</td>
</tr>
<tr>
<td>500 Internal Server Error</td>
<td>Unexpected error with the server. The response is accompanied by Error Object (XML).</td>
</tr>
<tr>
<td>503 Service Unavailable</td>
<td>Cannot proceed with the request, because some of the services are unavailable. Example: vShield Edge is Unreachable. The response is accompanied by Error Object (XML).</td>
</tr>
</tbody>
