Introduction

Networking and security are complex, dynamic areas, and VMware recognizes the need to bring best of breed solution from our partners to address customers need as they transition to virtual and cloud architectures. Customers can easily take advantage of a new vendor's technology and integrate operations with the existing systems and procedures, leading to improved levels of service and performance.

The Network and Security APIs allow partners to offer networking and security services over VMware platform. Partner integrate advanced solutions with VMware environment such as load balancing, WAN optimization, Antivirus (AV), File Integrity Monitoring (FIM), intrusion detection and prevention. Network and security solutions using physical appliance as well as virtual appliance created and certified via VMware Ready for Networking and Security programs are listed here.

Customers using these integrated products can leverage their existing investments in networking and security solutions while dramatically improving operational efficiency and agility in their datacenter.

Solutions certified under this category use one or more of these APIs in their integration:

* VMware Network Extensibility (NetX) for vSphere 5.1

NetX APIs are used to build networking and security services over VMware infrastructure. NetX APIs allows partners to integrate their existing or new solutions inside VMware work flow management and tap valuable information inside vSphere to provide their services. Currently solutions supported by these APIs include load-balancing (LB), WAN Optimization and intrusion detection and prevention (IDS/IPS) service integration.

* VMware Endpoint security (EPSec) for vSphere 5.0 and vSphere 5.1 EPSec APIs are used to deliver endpoint security solutions in a more efficient manner that does not require the management of resource-intensive agents inside the guest VM. The VMware EPSec APIs allows partners to eliminate the requirement for these agents and instead consolidate security intelligence into a single Security Virtual Appliance (SVA) per ESXi host. Currently, solutions supported by these APIs include anti-virus (AV), file integrity monitoring (FIM).

Please refer to the VMware Compatibility Guide for all partner related Networking and security providers.
