## Introduction

vSAN clusters server disks to create radically simple shared storage designed for virtual machines. vSAN automates storage provisioning and management with a self-tuning VM-centric approach. It enables two-click storage provisioning and automatically maintains the storage capacity, performance and availability required for individual VMs. By enabling a scale-out architecture with built-in read/write Flash caching, it delivers high performance, resiliency against multiple hardware failures and dynamic scalability. It reduces both capital and operating expenditures to deliver significantly lower TCO. Initial use cases include VDI, test/dev and tier2/3, vHadoop and DR targets
